1 Aim of the Experiment

The aim of the experiment was to identify protein differences as well as differences in total protein phosphorylation in patient and WT organoid samples.

2 Material & Methods

2.1 Samples and protein extraction

36 organoid samples were provided by the customer. The bulk protein concentration was determined by BCA assay (Table 1).

Table 1: Overview of samples sent for analysis and measured protein concentrations.

sample no.	sample ID Sciomics	sample ID Customer	sample group	status	Concentration [mg/ml]
1	BO001	WT_UN_T_10_R_1	WT_UN_T_10	WT	0.68
2	BO002	WT_UN_T_20_R_1	WT_UN_T_20	WT	0.64
3	BO003	WT_UN_T_30_R_1	WT_UN_T_30	WT	0.57
4	BO004	WT_CD_T_10_R_1	WT_CD_T_10	WT	0.66
5	BO005	WT_CD_T_20_R_1	WT_CD_T_20	WT	0.71
6	BO006	WT_CD_T_30_R_1	WT_CD_T_30	WT	0.38

33	BO033	PAT_UN_T_30_R_3	PAT_UN_T_30	Patient	0.73
34	BO034	PAT_CD_T_10_R_3	PAT_CD_T_10	Patient	0.76
35	BO035	PAT_CD_T_20_R_3	PAT_CD_T_20	Patient	0.83
36	BO036	PAT_CD_T_30_R_3	PAT_CD_T_30	Patient	0.72

2.2 Sample labelling

The samples were labelled at an adjusted protein concentration for two hours with scioDye 2. After two hours, the reaction was stopped. Excess dye was removed and the buffer exchanged to PBS. All labelled protein samples were stored at -20° C until use.

2.3 Sample incubation

The 36 samples were analysed on 36 scioDiscover antibody microarrays (Sciomics) targeting 1,360 different proteins with 1,830 antibodies. Each antibody is represented on the array in four replicates. The arrays were blocked with scioBlock (Sciomics) on a Hybstation 4800 (Tecan, Austria) and afterwards the samples as well as scioPhosphomix 1 were incubated. Via scioPhosphomix 1 information on protein specific phosphorylation levels at serine, threonine and tyrosine residues can be obtained. After incubation, the slides were thoroughly washed with 1x PBSTT, rinsed with 0.1x PBS as well as with water and subsequently dried with nitrogen.

2.4 Data acquisition and analysis

Slide scanning was conducted using a Powerscanner (Tecan, Austria) with identical instrument laser power and constant PMT settings. Spot segmentation was performed with GenePix Pro 6.0 (Molecular Devices, Union City, CA, USA). Acquired raw data were analysed using the linear models for microarray data (LIMMA) package of R-Bioconductor after uploading the median signal intensities. For normalisation, a Cyclic Loess normalisation was applied. For analysis of the samples a one-factorial linear model was fitted with LIMMA resulting in a two-sided t-test or F-test based on moderated statistics. All presented p values were adjusted for multiple testing by controlling the false discovery rate according to Benjamini and Hochberg. Proteins were defined as differential for $|logFC| > 0.5$ and an adjusted p value < 0.05 .

Differences in protein abundance or phosphorylation level between different samples or sample groups are presented as log-fold changes ($logFC$) calculated for the basis 2. In a study comparing samples versus control a $logFC = 1$ means that the sample group had on average a $2^1 = 2$ fold higher signal as the control group. $logFC = -1$ stands for $2^{-1} = 1/2$ of the signal in the sample as compared to the control group.

3 Results of protein expression analysis

3.1 Cluster analysis

3.1.1 Hierarchical cluster analysis

The cluster analysis for the protein signal data of the complete data set (Figure 1) reveals a rather clear clustering according to samples groups. The main cluster on the right contains only patient samples (day 20 and day 30 with a separative trend between both) and the cluster on the left contains all WT samples. On the far left side of the left main cluster 5 patient samples (all at day 10) can be found, suggesting that these 5 samples are closer to the WT samples in terms of the overall protein landscape. There are two samples BO007 and BO036 which are located between the two main clusters and might be considered being outliers.

A further cluster analysis was performed with only the differential data set (Figure 2). The cluster analysis with the differential proteins reveals a clear separation between WT and patient samples. Within the WT and patient samples cluster day 10 samples cluster apart from day 20 and day 30 samples.

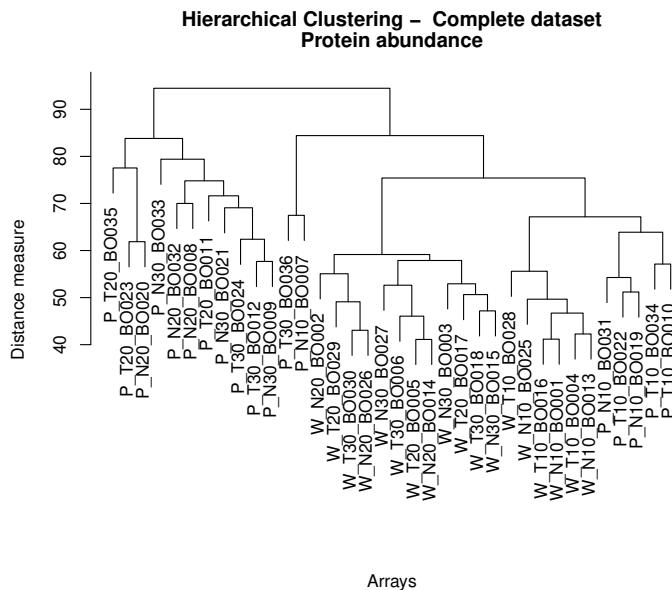

Figure 1: Hierarchical clustering of the samples' protein signal data using complete array data.

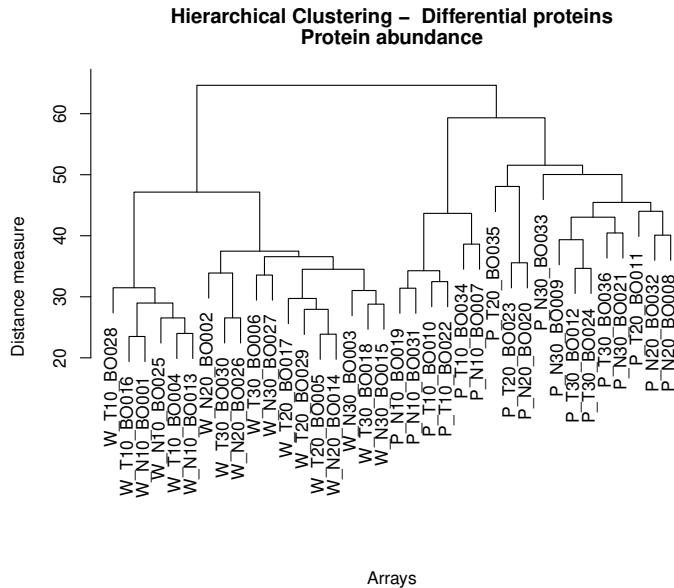

Figure 2: Hierarchical clustering of the samples' protein signal data based on differential proteins.

3.1.2 Non-metric multidimensional scaling

In addition, a non-metric multidimensional scaling (NMDS) was performed for the array data (Figure 3) as well as for the array data filtered for differential proteins (Figure 4). In this plot, the location and proximity of the samples is defined by the protein profile of the respective arrays. Samples with a similar profile are located in close proximity.

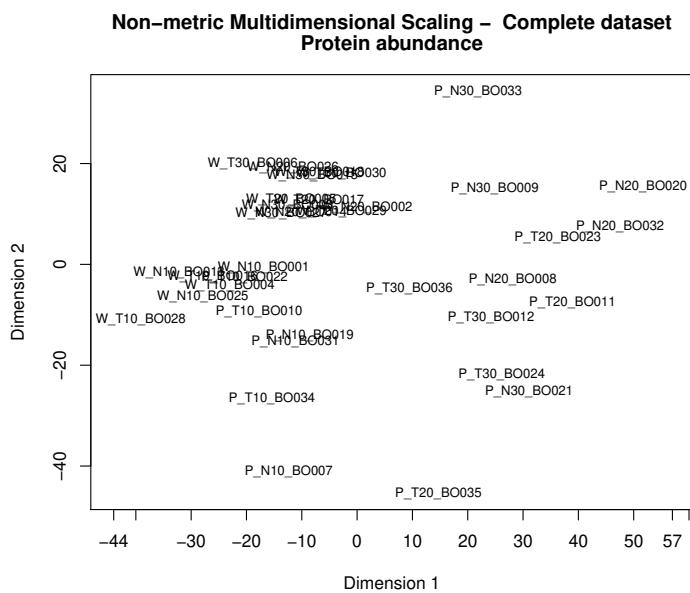

Figure 3: Non-metric multidimensional scaling plot of the samples' protein signal data using complete array data.

3 Results of protein expression analysis

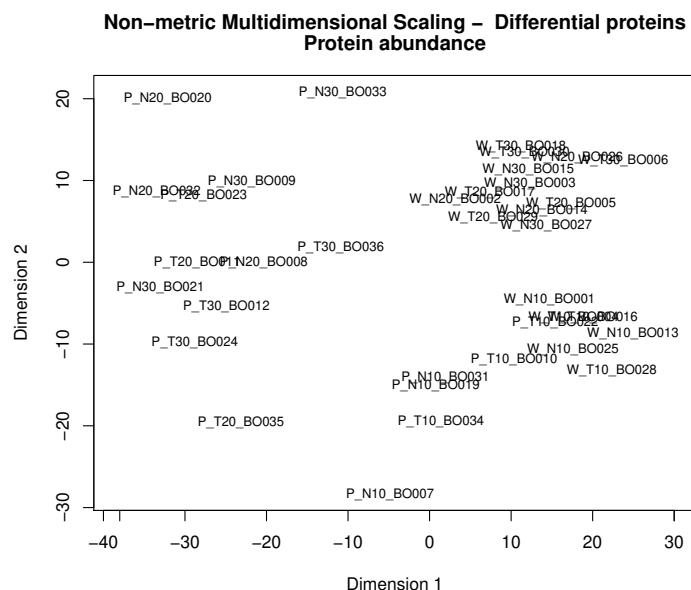

Figure 4: Non-metric multidimensional scaling plot of the samples' protein signal data based on differential proteins.

3.2 Differentially abundant proteins

3.2.1 Untreated Day10: PAT vs WT

Between PAT-untreated Day10 and WT-untreated Day10, 189 antibodies recorded a differential protein abundance. The results of the statistical analysis are summarised in the volcano plot (Figure 5) and listed in Table 2.

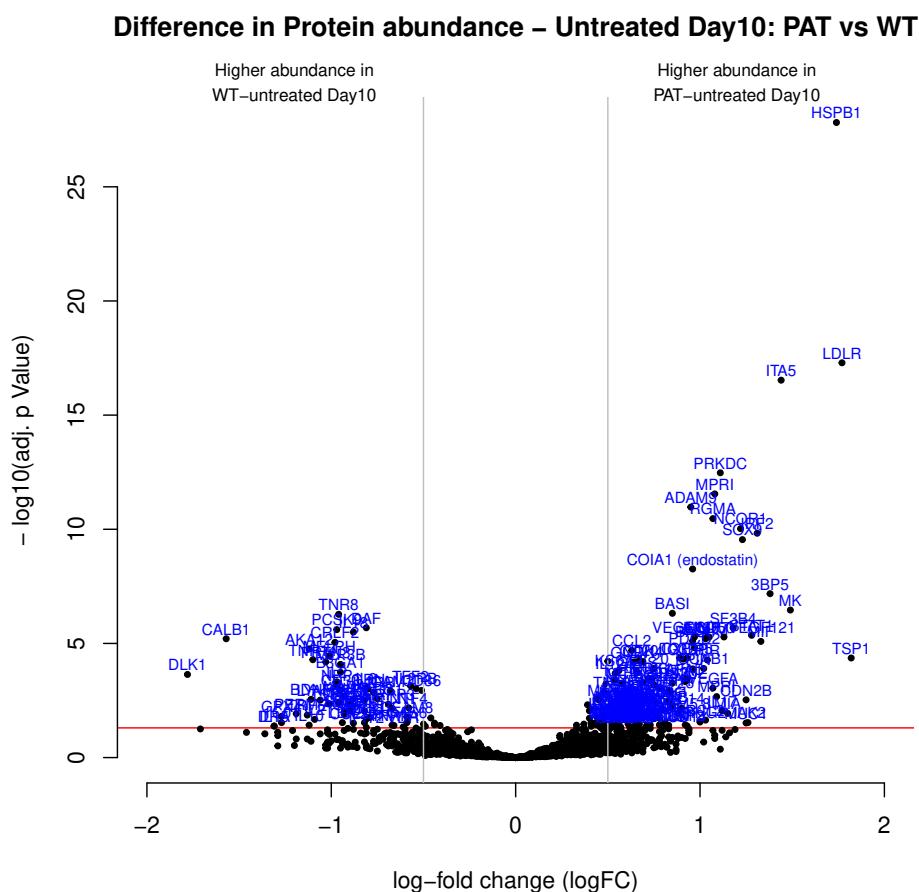

Figure 5: Several proteins exhibited distinct abundance variations in PAT-untreated Day10 and WT-untreated Day10. The volcano plot visualises the p values (adjusted for multiple testing) and corresponding log-fold changes (logFC). A significance level of adj. p Value = 0.05 is indicated as a horizontal red line. The logFC cutoffs are indicated as vertical lines. Proteins with a positive logFC had a higher abundance in PAT-untreated Day10, proteins with a negative value in WT-untreated Day10.

3 Results of protein expression analysis

Table 2: Proteins with differential abundance in PAT-untreated Day10 and WT-untreated Day10. Proteins with a positive logFC value had a higher abundance in PAT-untreated Day10, proteins with a negative value in WT-untreated Day10. In addition, p values adjusted for multiple testing are listed. The Uniprot-Identifier links to the Uniprot-Entry.

3.2.2 Untreated Day20: PAT vs WT

Between PAT-untreated Day20 and WT-untreated Day20, 324 antibodies recorded a differential protein abundance. The results of the statistical analysis are summarised in the volcano plot (Figure 6) and listed in Table 3.

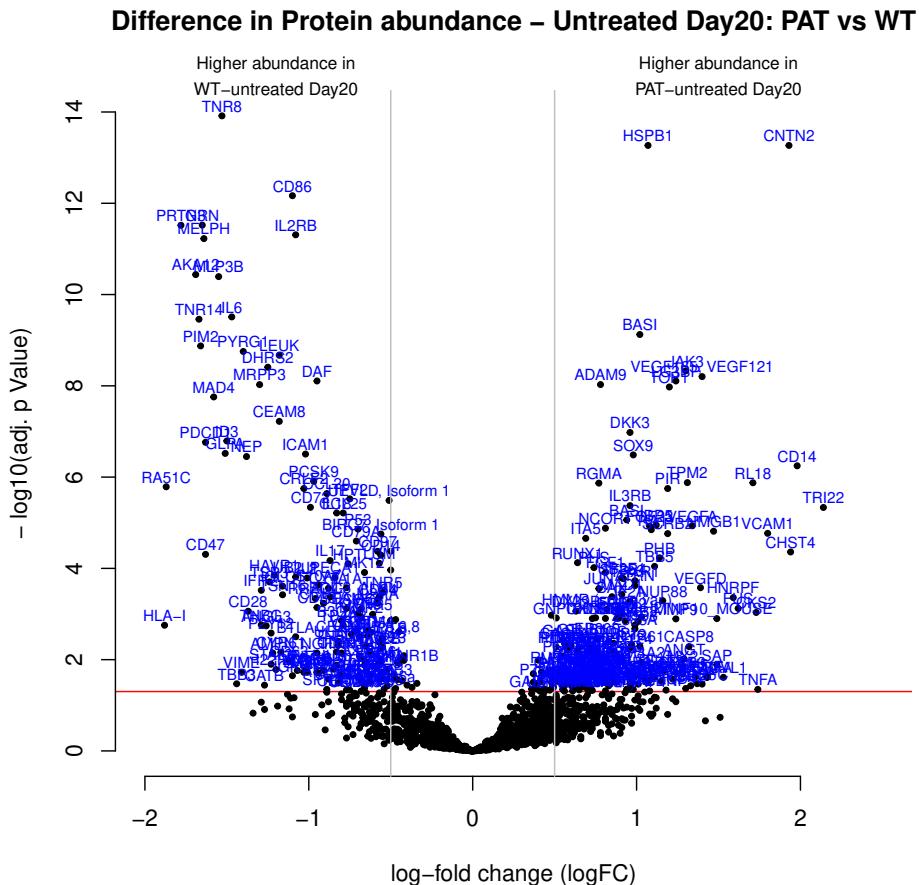

Figure 6: Several proteins exhibited distinct abundance variations in PAT-untreated Day20 and WT-untreated Day20. The volcano plot visualises the p values (adjusted for multiple testing) and corresponding log-fold changes (logFC). A significance level of adj. p Value = 0.05 is indicated as a horizontal red line. The logFC cutoffs are indicated as vertical lines. Proteins with a positive logFC had a higher abundance in PAT-untreated Day20, proteins with a negative value in WT-untreated Day20.

3 Results of protein expression analysis

Table 3: Proteins with differential abundance in PAT-untreated Day20 and WT-untreated Day20. Proteins with a positive logFC value had a higher abundance in PAT-untreated Day20, proteins with a negative value in WT-untreated Day20. In addition, p values adjusted for multiple testing are listed. The Uniprot-Identifier links to the Uniprot-Entry.

3.2.3 Untreated Day30: PAT vs WT

Between PAT-untreated Day30 and WT-untreated Day30, 284 antibodies recorded a differential protein abundance. The results of the statistical analysis are summarised in the volcano plot (Figure 7) and listed in Table 4.

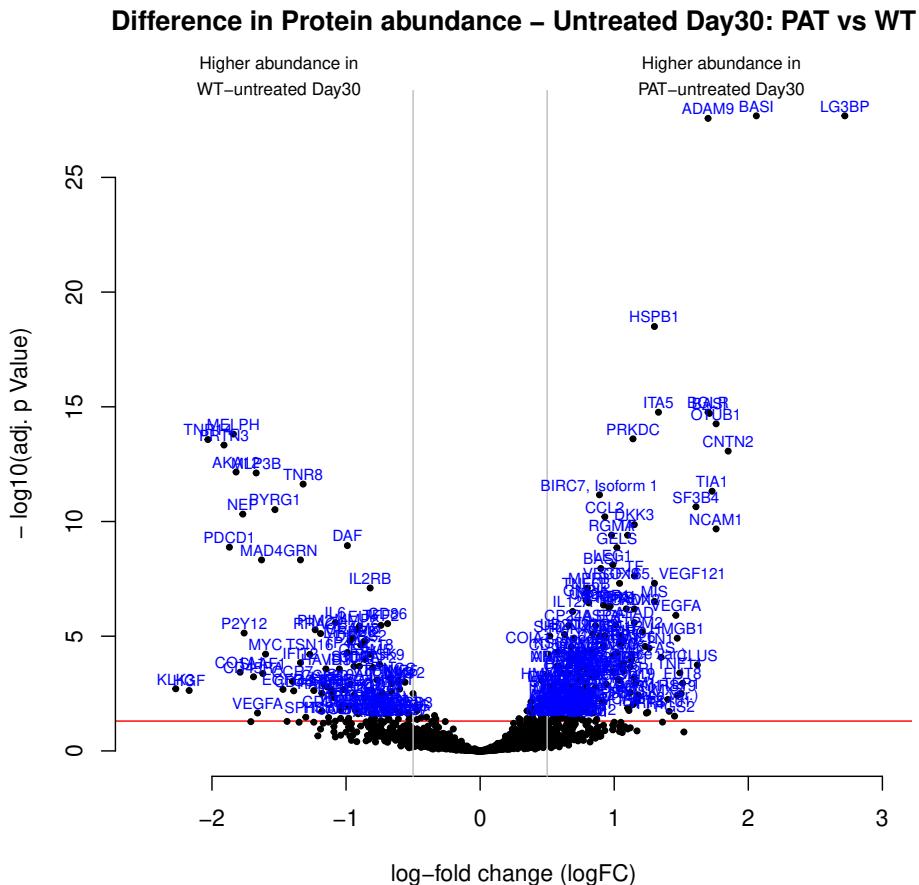

Figure 7: Several proteins exhibited distinct abundance variations in PAT-untreated Day30 and WT-untreated Day30. The volcano plot visualises the p values (adjusted for multiple testing) and corresponding log-fold changes (logFC). A significance level of adj. p Value = 0.05 is indicated as a horizontal red line. The logFC cutoffs are indicated as vertical lines. Proteins with a positive logFC had a higher abundance in PAT-untreated Day30, proteins with a negative value in WT-untreated Day30.

3 Results of protein expression analysis

Table 4: Proteins with differential abundance in PAT-untreated Day30 and WT-untreated Day30. Proteins with a positive logFC value had a higher abundance in PAT-untreated Day30, proteins with a negative value in WT-untreated Day30. In addition, p values adjusted for multiple testing are listed. The Uniprot-Identifier links to the Uniprot-Entry.

3.2.4 Treated Day10: PAT vs WT

Between PAT-treated Day10 and WT-treated Day10, 42 antibodies recorded a differential protein abundance. The results of the statistical analysis are summarised in the volcano plot (Figure 8) and listed in Table 5.

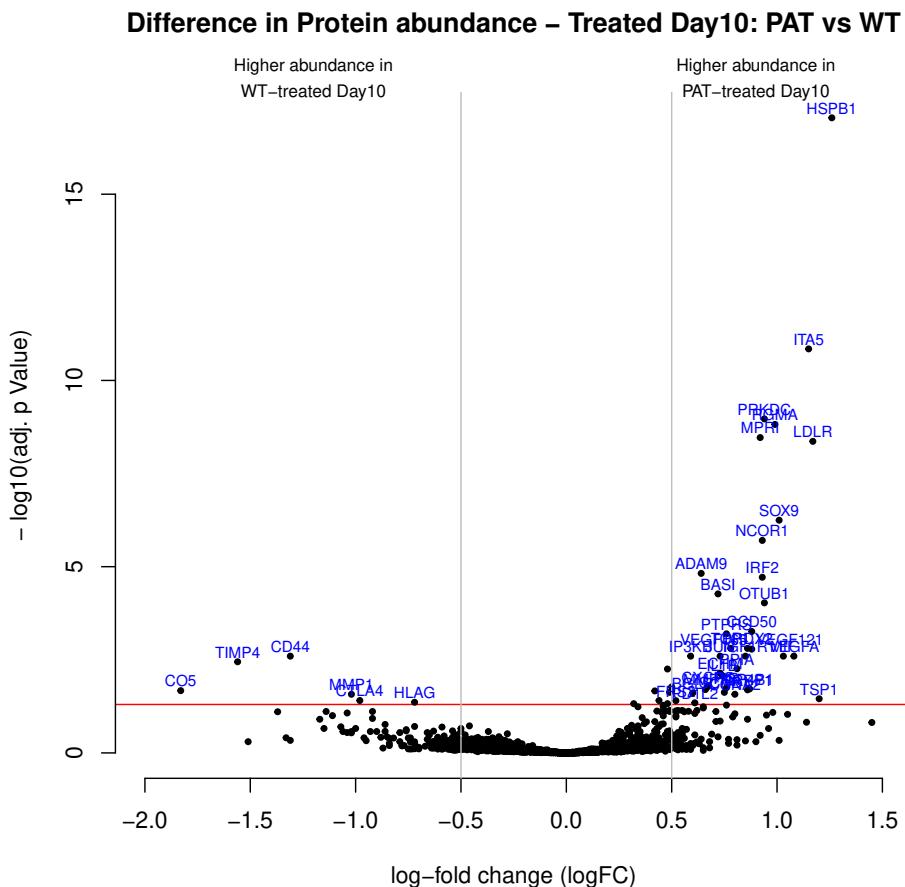

Figure 8: Several proteins exhibited distinct abundance variations in PAT-treated Day10 and WT-treated Day10. The volcano plot visualises the p values (adjusted for multiple testing) and corresponding log-fold changes (logFC). A significance level of adj. p Value = 0.05 is indicated as a horizontal red line. The logFC cutoffs are indicated as vertical lines. Proteins with a positive logFC had a higher abundance in PAT-treated Day10, proteins with a negative value in WT-treated Day10.

3 Results of protein expression analysis

Table 5: Proteins with differential abundance in PAT-treated Day10 and WT-treated Day10. Proteins with a positive logFC value had a higher abundance in PAT-treated Day10, proteins with a negative value in WT-treated Day10. In addition, p values adjusted for multiple testing are listed. 3.2.5 Treated Day20: PAT vs WT

Between PAT-treated Day20 and WT-treated Day20, 318 antibodies recorded a differential protein abundance. The results of the statistical analysis are summarised in the volcano plot (Figure 9) and listed in Table 6.

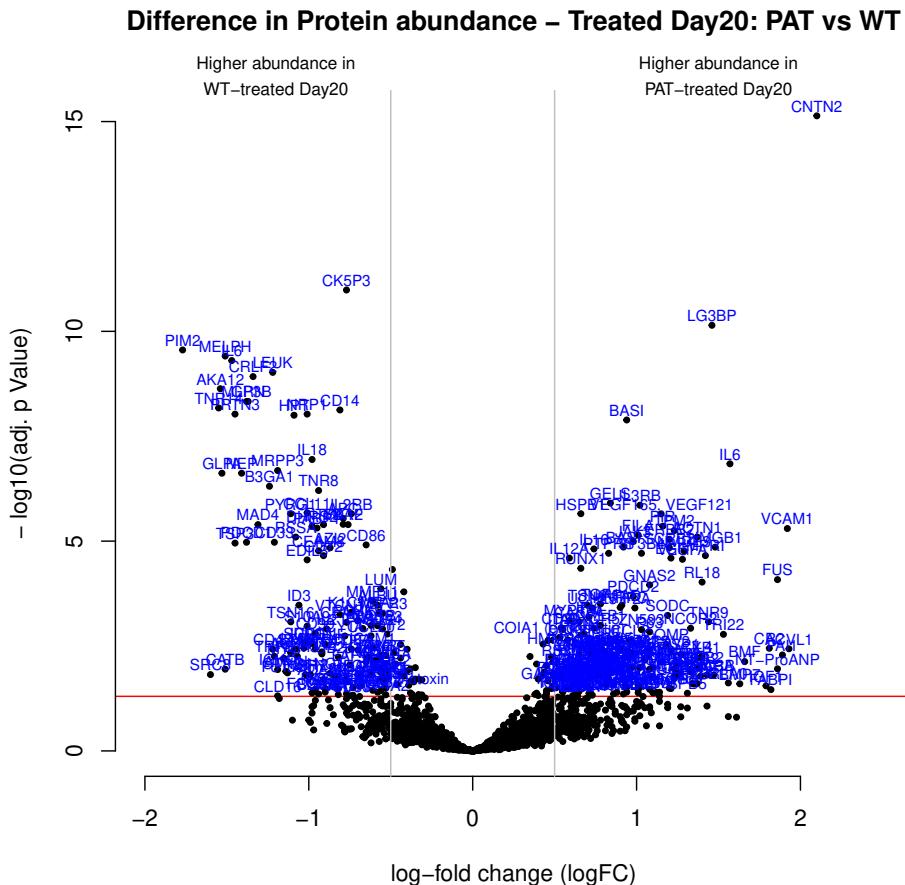

Figure 9: Several proteins exhibited distinct abundance variations in PAT-treated Day20 and WT-treated Day20. The volcano plot visualises the p values (adjusted for multiple testing) and corresponding log-fold changes (logFC). A significance level of adj. p Value = 0.05 is indicated as a horizontal red line. The logFC cutoffs are indicated as vertical lines. Proteins with a positive logFC had a higher abundance in PAT-treated Day20, proteins with a negative value in WT-treated Day20.

3 Results of protein expression analysis

Table 6: Proteins with differential abundance in PAT-treated Day20 and WT-treated Day20. Proteins with a positive logFC value had a higher abundance in PAT-treated Day20, proteins with a negative value in WT-treated Day20. In addition, p values adjusted for multiple testing are listed. The Uniprot-Identifier links to the Uniprot-Entry.

3.2.6 Treated Day30: PAT vs WT

Between PAT-treated Day30 and WT-treated Day30, 369 antibodies recorded a differential protein abundance. The results of the statistical analysis are summarised in the volcano plot (Figure 10) and listed in Table 7.

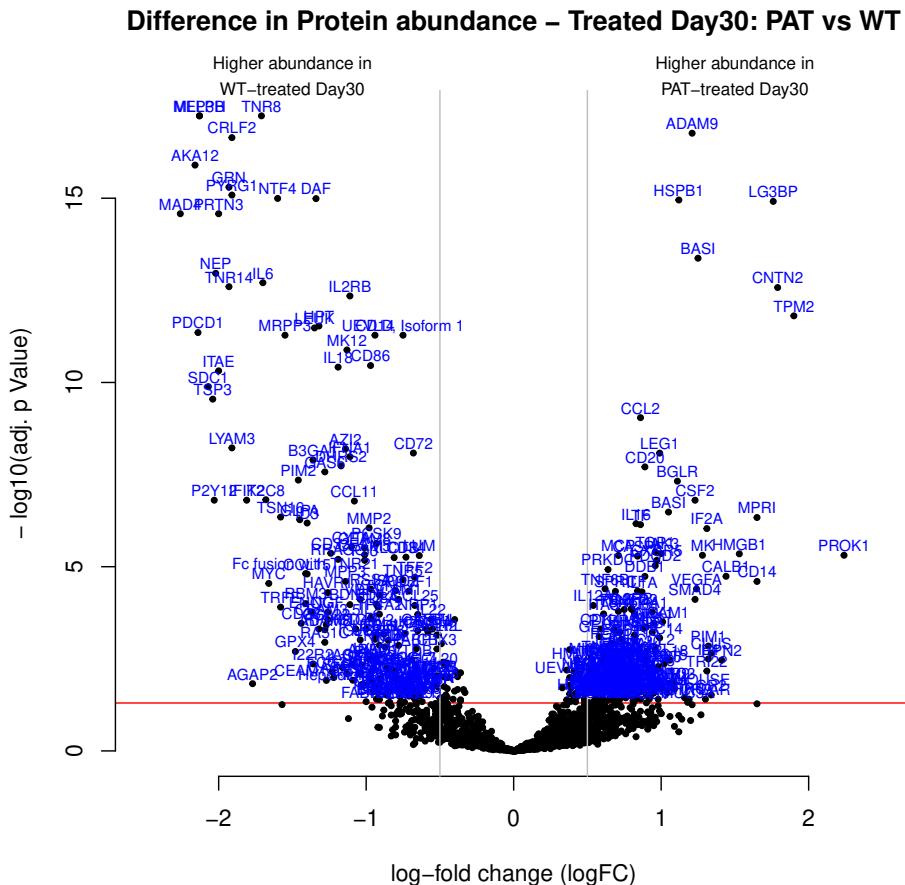

Figure 10: Several proteins exhibited distinct abundance variations in PAT-treated Day30 and WT-treated Day30. The volcano plot visualises the p values (adjusted for multiple testing) and corresponding log-fold changes (logFC). A significance level of adj. p Value = 0.05 is indicated as a horizontal red line. The logFC cutoffs are indicated as vertical lines. Proteins with a positive logFC had a higher abundance in PAT-treated Day30, proteins with a negative value in WT-treated Day30.

3 Results of protein expression analysis

Table 7: Proteins with differential abundance in PAT-treated Day30 and WT-treated Day30. Proteins with a positive logFC value had a higher abundance in PAT-treated Day30, proteins with a negative value in WT-treated Day30. In addition, p values adjusted for multiple testing are listed. The Uniprot-Identifier links to the Uniprot-Entry.

3.2.7 PAT Day10: Treated vs Untreated

Between PAT-treated Day10 and PAT-untreated Day10, 5 antibodies recorded a differential protein abundance. The results of the statistical analysis are summarised in the volcano plot (Figure 11) and listed in Table 8.

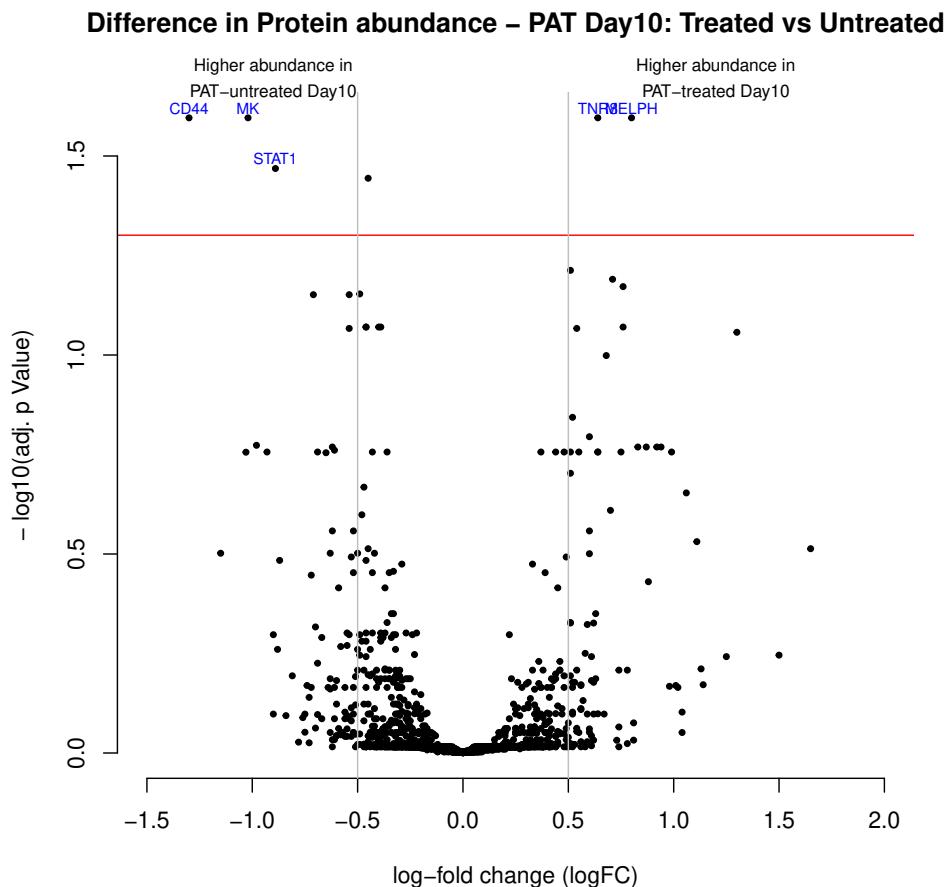

Figure 11: Several proteins exhibited distinct abundance variations in PAT-treated Day10 and PAT-untreated Day10. The volcano plot visualises the p values (adjusted for multiple testing) and corresponding log-fold changes (logFC). A significance level of adj. p Value = 0.05 is indicated as a horizontal red line. The logFC cutoffs are indicated as vertical lines. Proteins with a positive logFC had a higher abundance in PAT-treated Day10, proteins with a negative value in PAT-untreated Day10.

3 Results of protein expression analysis

Table 8: Proteins with differential abundance in PAT-treated Day10 and PAT-untreated Day10. Proteins with a positive logFC value had a higher abundance in PAT-treated Day10, proteins with a negative value in PAT-untreated Day10. In addition, p values adjusted for multiple testing are listed. The Uniprot-Identifier links to the Uniprot-Entry.

Protein	AntibodyID	Uniprot-Entry-Name	Uniprot-Entry	HGNC	logFC	AveExp	adj.P.Val

3.3 Individual protein levels

For some differential proteins relative protein levels are presented in Figure 14.

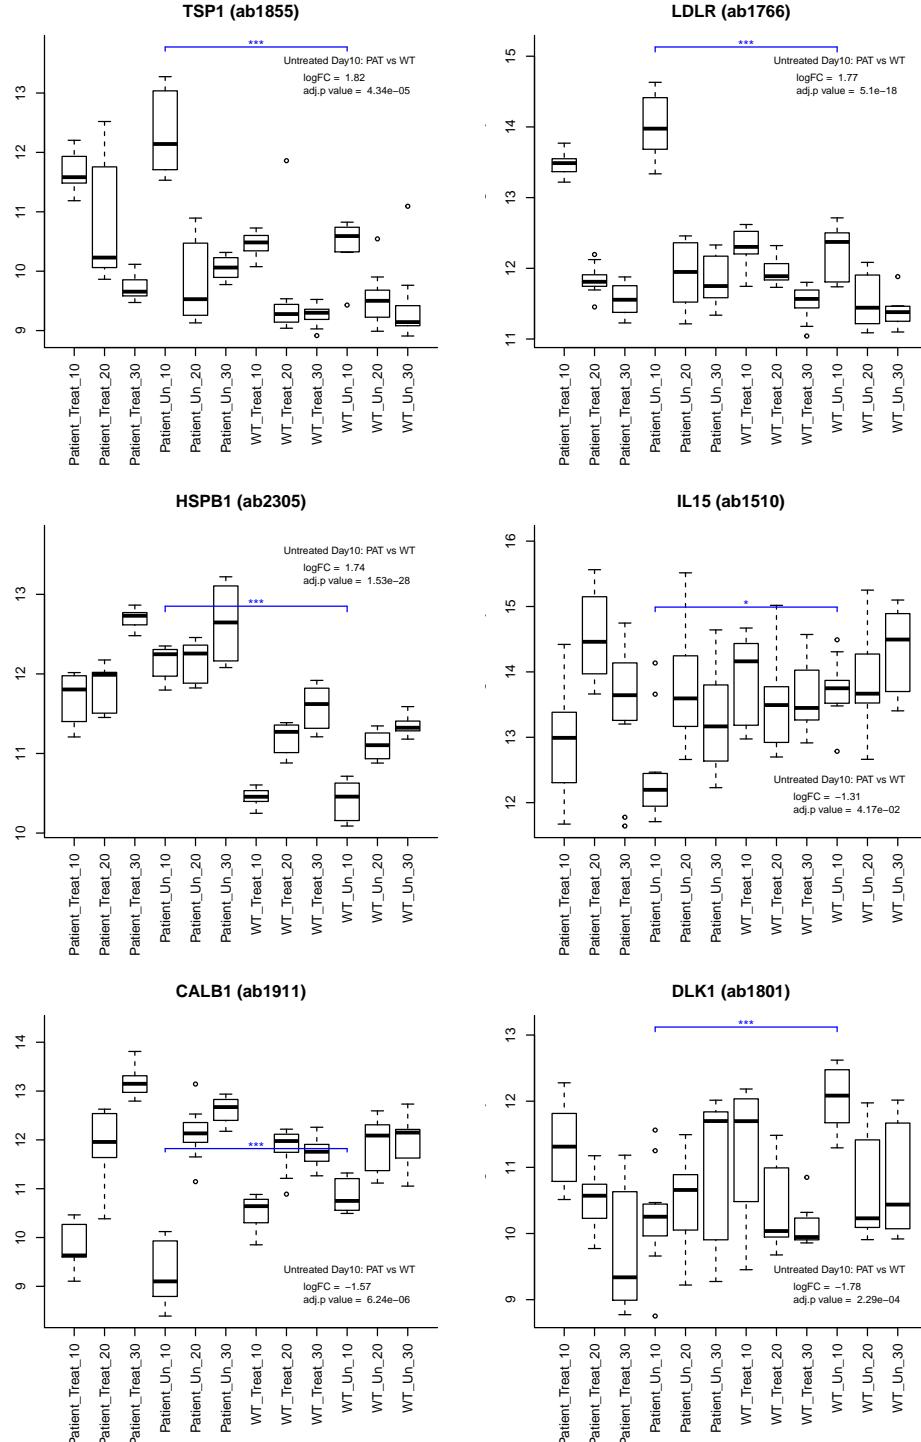

Figure 14: Individual array values for a set of differential proteins. Each sample is measured by four replicate spots per array.

4 Results of protein phosphorylation analysis

4.1 Cluster analysis

4.1.1 Hierarchical cluster analysis

The cluster analysis for the phosphorylation signal data of the complete data set (Figure 15) reveals a separation according to day of treatment. All day 10 samples (WT and patient) cluster to the right and all day 20 and day 30 samples are on the left side of the plot. For the day 20 and day 30 samples there is a slight trend of a separation.

A further cluster analysis was performed with only the differential data set (Figure 16). The cluster analysis with the differential proteins reveals a separation in three main clusters. The one on the right contains day 10 samples (WT and patient). The middle cluster mainly contains patient samples day 20 and day 30 and the cluster on the left contains day 20 and day 30 WT samples.

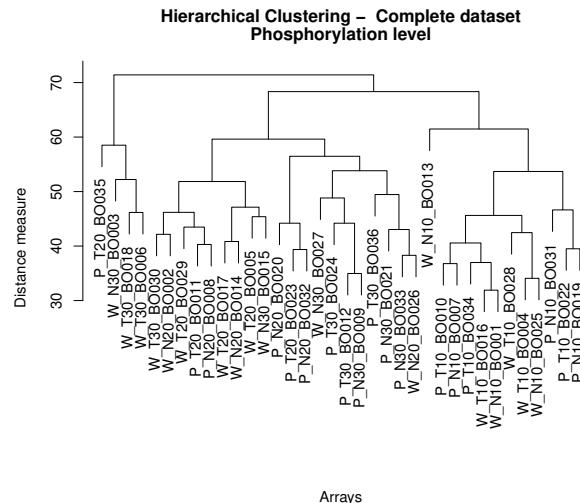

Figure 15: Hierarchical clustering of the samples' phosphorylation signal data using complete array data.

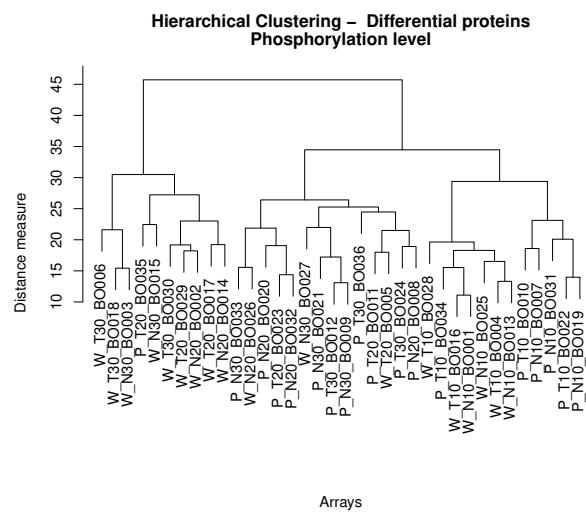

Figure 16: Hierarchical clustering of the samples' phosphorylation signal data based on differential proteins.

4.1.2 Non-metric multidimensional scaling

In addition, a non-metric multidimensional scaling (NMDS) was performed for the array data (Figure 17) as well as for the array data filtered for differential proteins (Figure 18). In this plot, the location and proximity of the samples is defined by the protein profile of the respective arrays. Samples with a similar profile are located in close proximity.

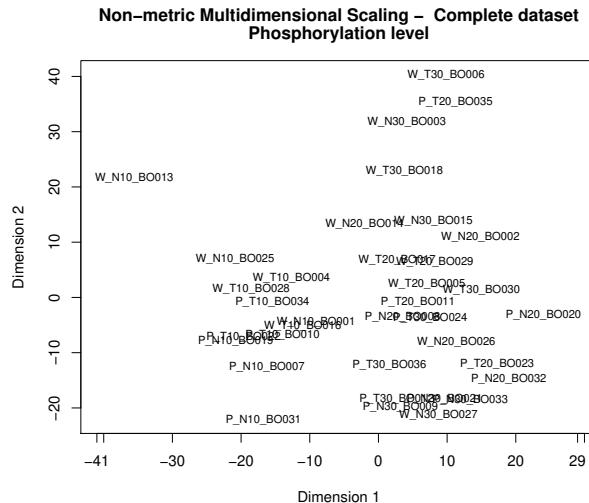

Figure 17: Non-metric multidimensional scaling plot of the samples' phosphorylation signal data using complete array data.

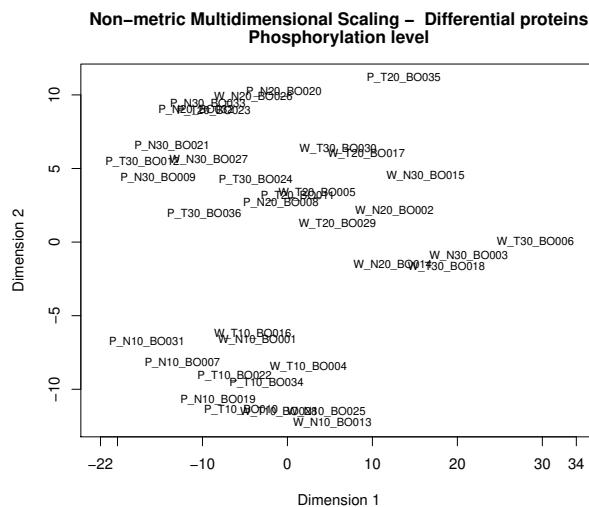

Figure 18: Non-metric multidimensional scaling plot of the samples' phosphorylation signal data based on differential proteins.

4.2 Differentially phosphorylated proteins

4.2.1 Untreated Day10: PAT vs WT

Between PAT-untreated Day10 and WT-untreated Day10, 28 antibodies recorded a differential protein phosphorylation. The results of the statistical analysis are summarised in the volcano plot (Figure 19) and listed in Table 11. Furthermore, an overview of proteins with differential abundance as well as phosphorylation levels is presented in Figure 20.

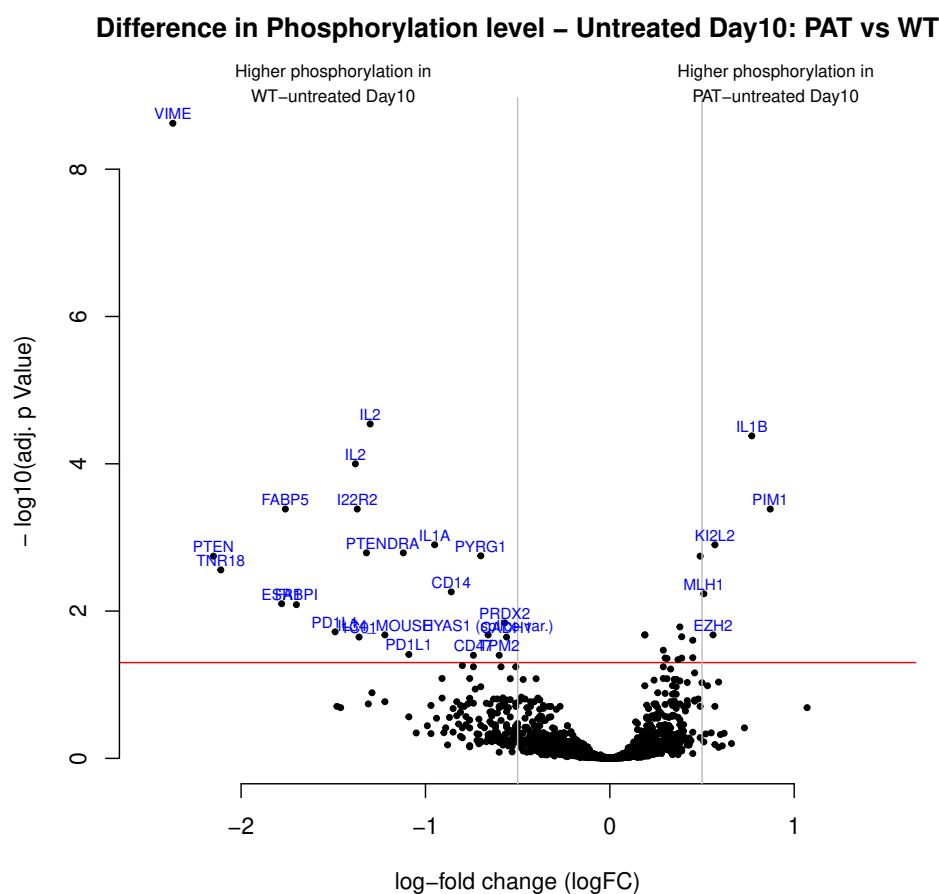

Figure 19: Several proteins exhibited distinct phosphorylation variations in PAT-untreated Day10 and WT-untreated Day10. The volcano plot visualises the p values (adjusted for multiple testing) and corresponding log-fold changes (logFC). A significance level of adj. p Value = 0.05 is indicated as a horizontal red line. The logFC cutoffs are indicated as vertical lines. Proteins with a positive logFC were more phosphorylated in PAT-untreated Day10, proteins with a negative value in WT-untreated Day10.

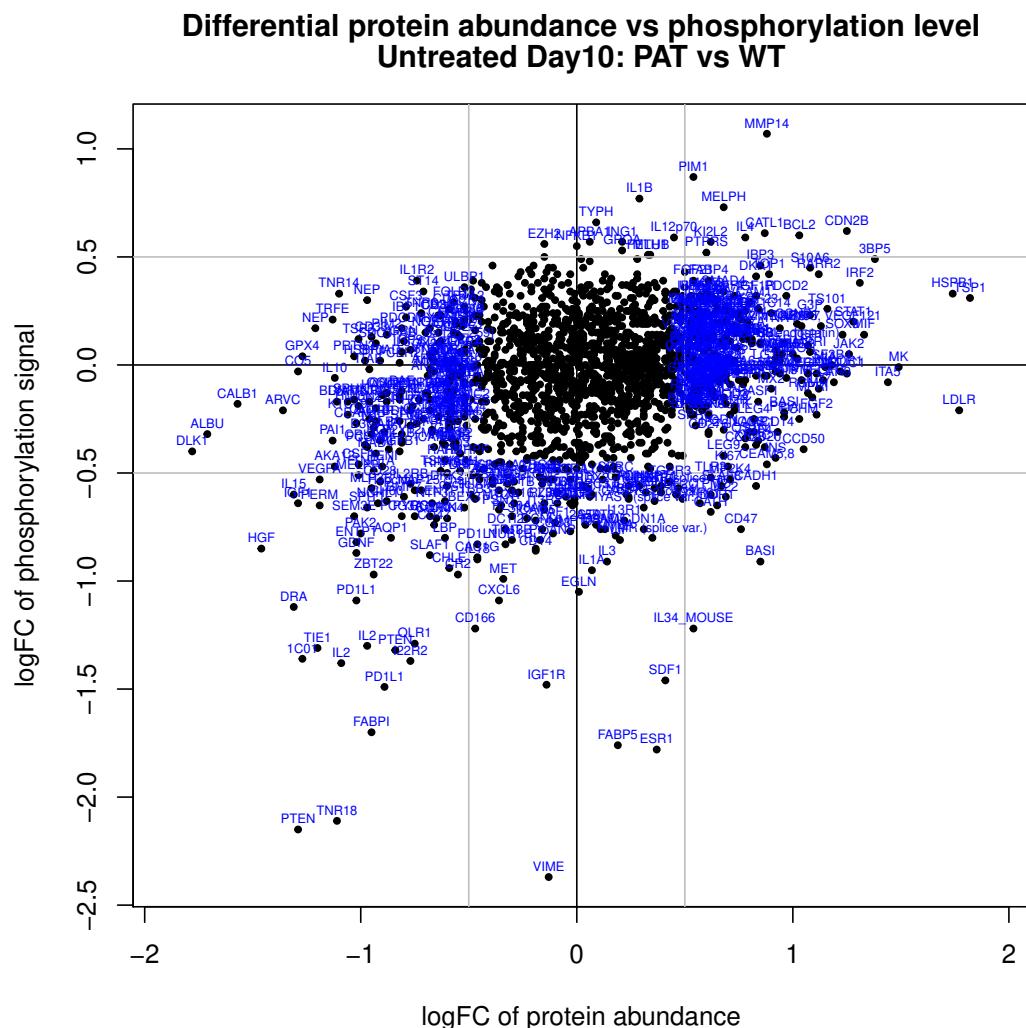

Figure 20: Overview of differences in protein abundance as well as phosphorylation levels between PAT-untreated Day10 and WT-untreated Day10. Proteins with a positive logFC protein (x-axis) were higher abundant in PAT-untreated Day10, while proteins with a negative logFC protein were higher abundant in WT-untreated Day10. For proteins with a positive logFC phos (y-axis) higher phosphorylation signals were obtained in PAT-untreated Day10. For proteins with a negative logFC phos higher phosphorylation signals were obtained in WT-untreated Day10.

4 Results of protein phosphorylation analysis

Table 11: Proteins with differential phosphorylation in PAT-untreated Day10 and WT-untreated Day10. Proteins with a positive logFC value were more phosphorylated in PAT-untreated Day10, proteins with a negative value in WT-untreated Day10. In addition, p values adjusted for multiple testing are listed. The Uniprot-Identifier links to the Uniprot-Entry.

4.2.2 Untreated Day20: PAT vs WT

Between PAT-untreated Day20 and WT-untreated Day20, 20 antibodies recorded a differential protein phosphorylation. The results of the statistical analysis are summarised in the volcano plot (Figure 21) and listed in Table 12. Furthermore, an overview of proteins with differential abundance as well as phosphorylation levels is presented in Figure 22.

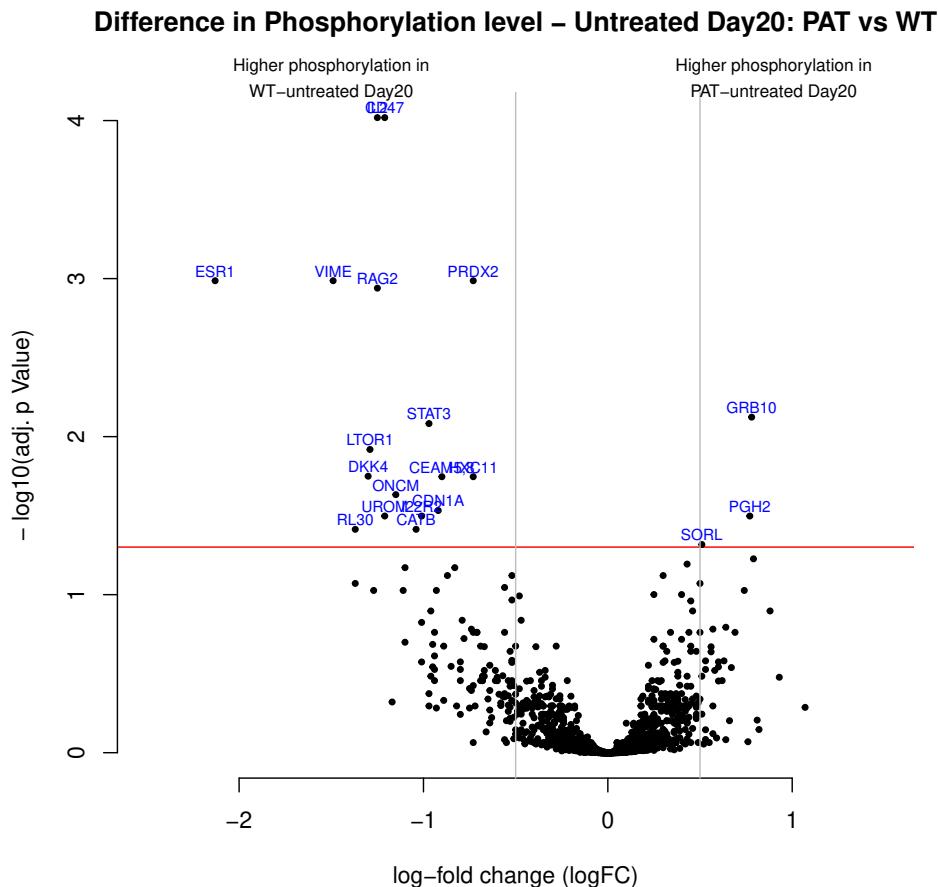

Figure 21: Several proteins exhibited distinct phosphorylation variations in PAT-untreated Day20 and WT-untreated Day20. The volcano plot visualises the p values (adjusted for multiple testing) and corresponding log-fold changes (logFC). A significance level of adj. p Value = 0.05 is indicated as a horizontal red line. The logFC cutoffs are indicated as vertical lines. Proteins with a positive logFC were more phosphorylated in PAT-untreated Day20, proteins with a negative value in WT-untreated Day20.

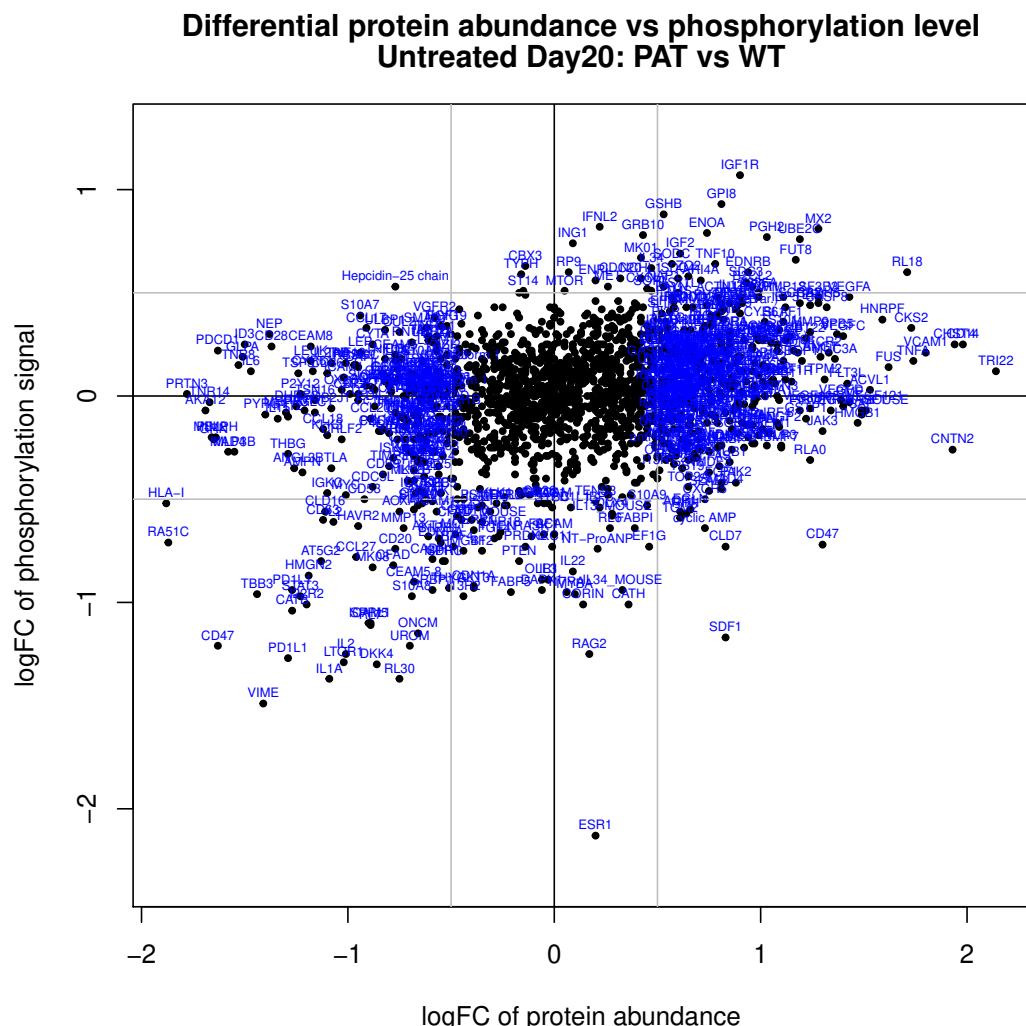

Figure 22: Overview of differences in protein abundance as well as phosphorylation levels between PAT-untreated Day20 and WT-untreated Day20. Proteins with a positive logFC protein (x-axis) were higher abundant in PAT-untreated Day20, while proteins with a negative logFC protein were higher abundant in WT-untreated Day20. For proteins with a postive logFC phos (y-axis) higher phosphorylation signals were obtained in PAT-untreated Day20. For proteins with a negative logFC phos higher phosphorylation signals were obtained in WT-untreated Day20.

4 Results of protein phosphorylation analysis

Table 12: Proteins with differential phosphorylation in PAT-untreated Day20 and WT-untreated Day20. Proteins with a positive logFC value were more phosphorylated in PAT-untreated Day20, proteins with a negative value in WT-untreated Day20. In addition, p values adjusted for multiple testing are listed. The Uniprot-Identifier links to the Uniprot-Entry.

4.2.3 Untreated Day30: PAT vs WT

Between PAT-untreated Day30 and WT-untreated Day30, 140 antibodies recorded a differential protein phosphorylation. The results of the statistical analysis are summarised in the volcano plot (Figure 23) and listed in Table 13. Furthermore, an overview of proteins with differential abundance as well as phosphorylation levels is presented in Figure 24.

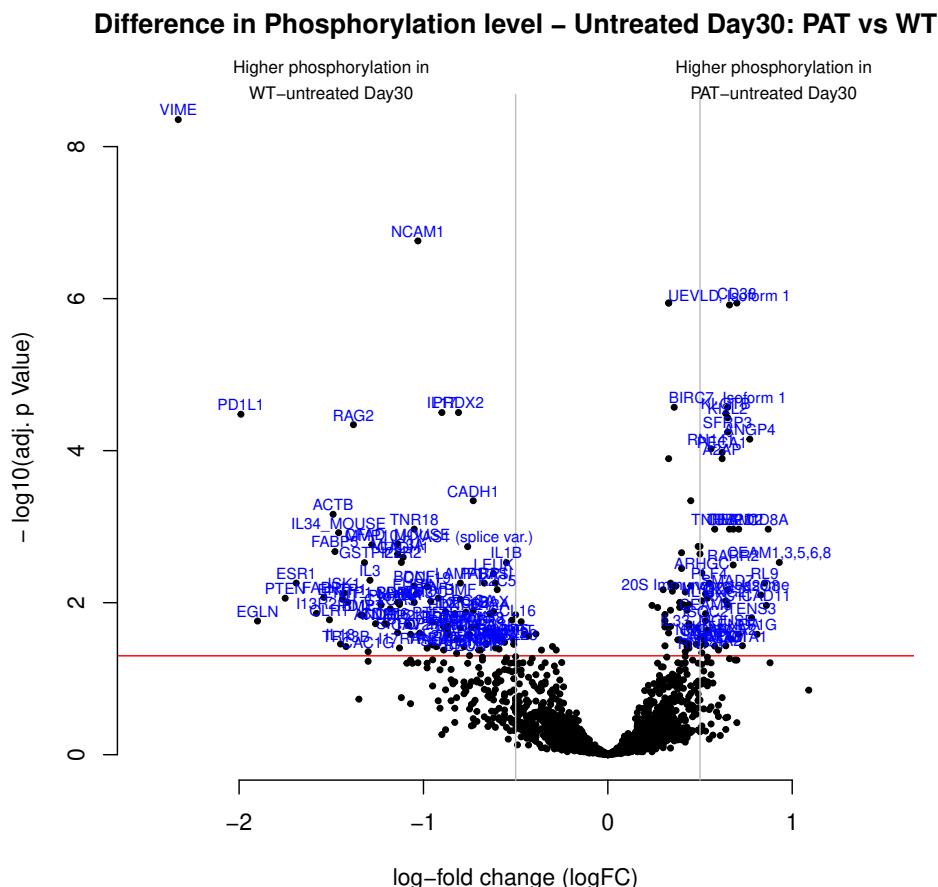

Figure 23: Several proteins exhibited distinct phosphorylation variations in PAT-untreated Day30 and WT-untreated Day30. The volcano plot visualises the p values (adjusted for multiple testing) and corresponding log-fold changes (logFC). A significance level of adj. p Value = 0.05 is indicated as a horizontal red line. The logFC cutoffs are indicated as vertical lines. Proteins with a positive logFC were more phosphorylated in PAT-untreated Day30, proteins with a negative value in WT-untreated Day30.

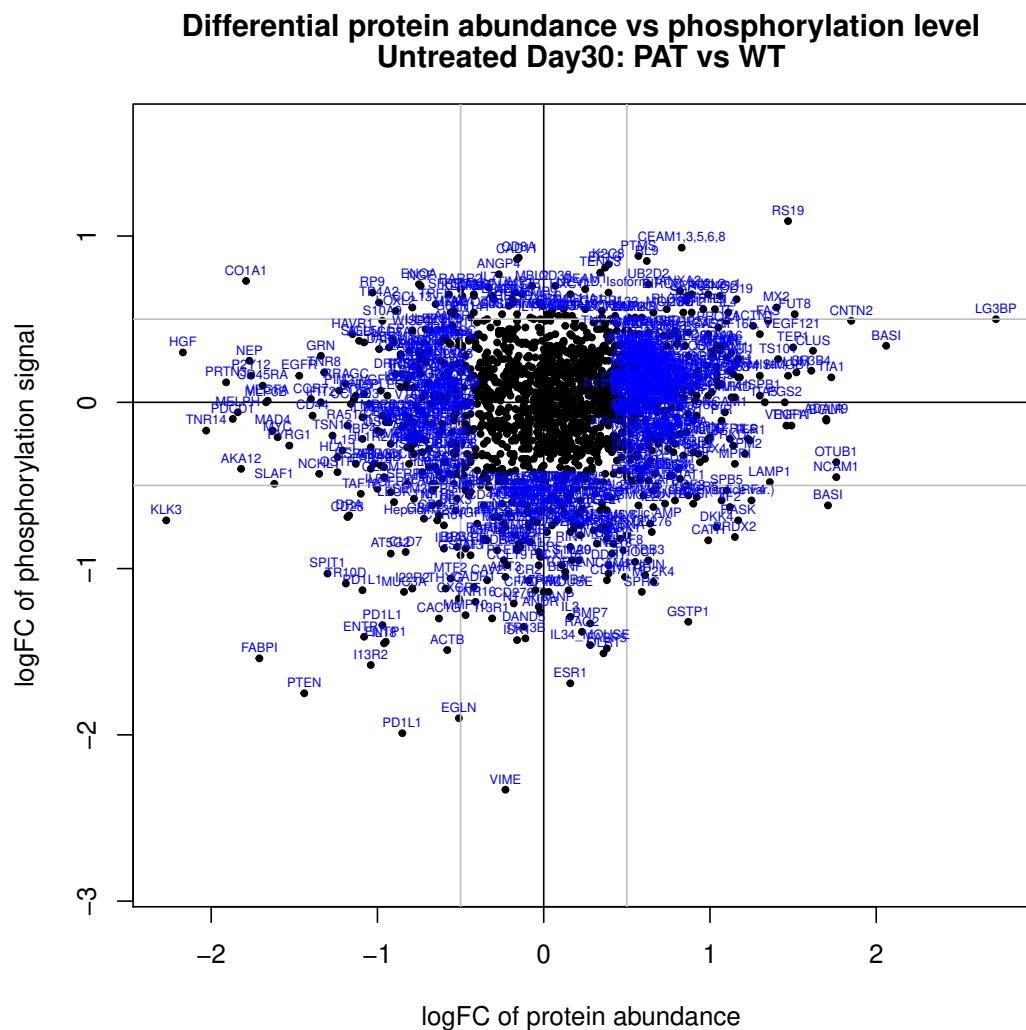

Figure 24: Overview of differences in protein abundance as well as phosphorylation levels between PAT-untreated Day30 and WT-untreated Day30. Proteins with a positive logFC protein (x-axis) were higher abundant in PAT-untreated Day30, while proteins with a negative logFC protein were higher abundant in WT-untreated Day30. For proteins with a postive logFC phos (y-axis) higher phosphorylation signals were obtained in PAT-untreated Day30. For proteins with a negative logFC phos higher phosphorylation signals were obtained in WT-untreated Day30.

4 Results of protein phosphorylation analysis

Table 13: Proteins with differential phosphorylation in PAT-untreated Day30 and WT-untreated Day30. Proteins with a positive logFC value were more phosphorylated in PAT-untreated Day30, proteins with a negative value in WT-untreated Day30. In addition, p values adjusted for multiple testing are listed. The Uniprot-Identifier links to the Uniprot-Entry.

4.2.4 Treated Day10: PAT vs WT

Between PAT-treated Day10 and WT-treated Day10, 2 antibodies recorded a differential protein phosphorylation. The results of the statistical analysis are summarised in the volcano plot (Figure 25) and listed in Table 14. Furthermore, an overview of proteins with differential abundance as well as phosphorylation levels is presented in Figure 26.

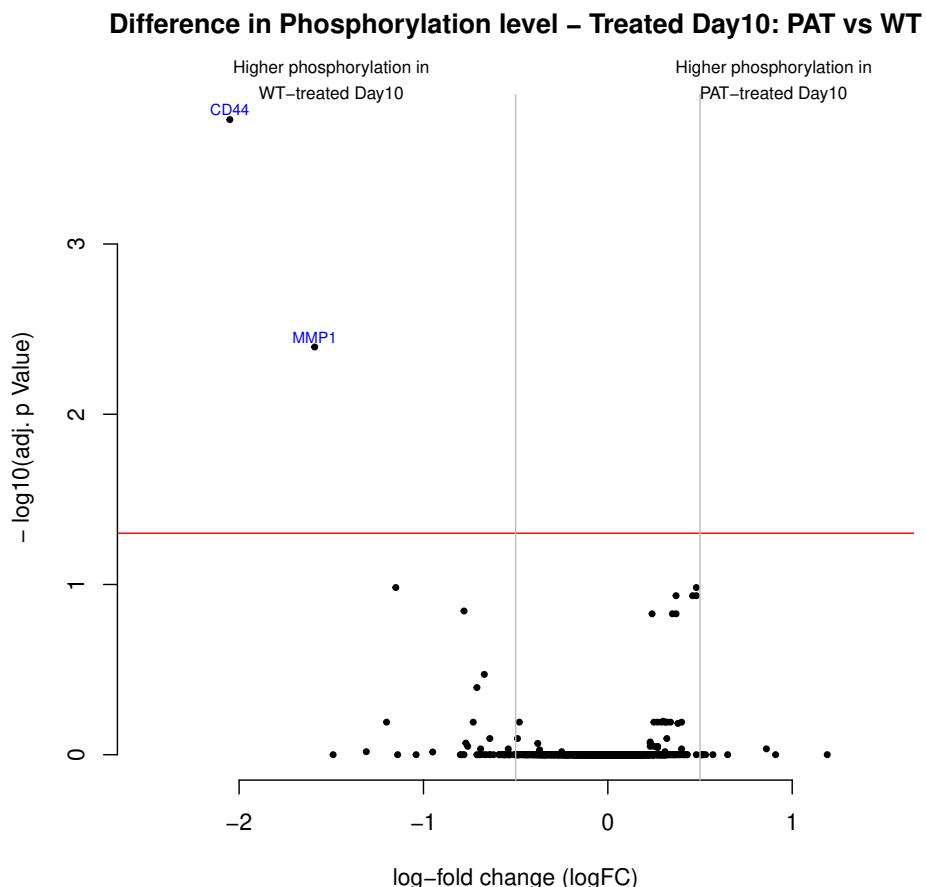

Figure 25: Several proteins exhibited distinct phosphorylation variations in PAT-treated Day10 and WT-treated Day10. The volcano plot visualises the p values (adjusted for multiple testing) and corresponding log-fold changes (logFC). A significance level of adj. p Value = 0.05 is indicated as a horizontal red line. The logFC cutoffs are indicated as vertical lines. Proteins with a positive logFC were more phosphorylated in PAT-treated Day10, proteins with a negative value in WT-treated Day10.

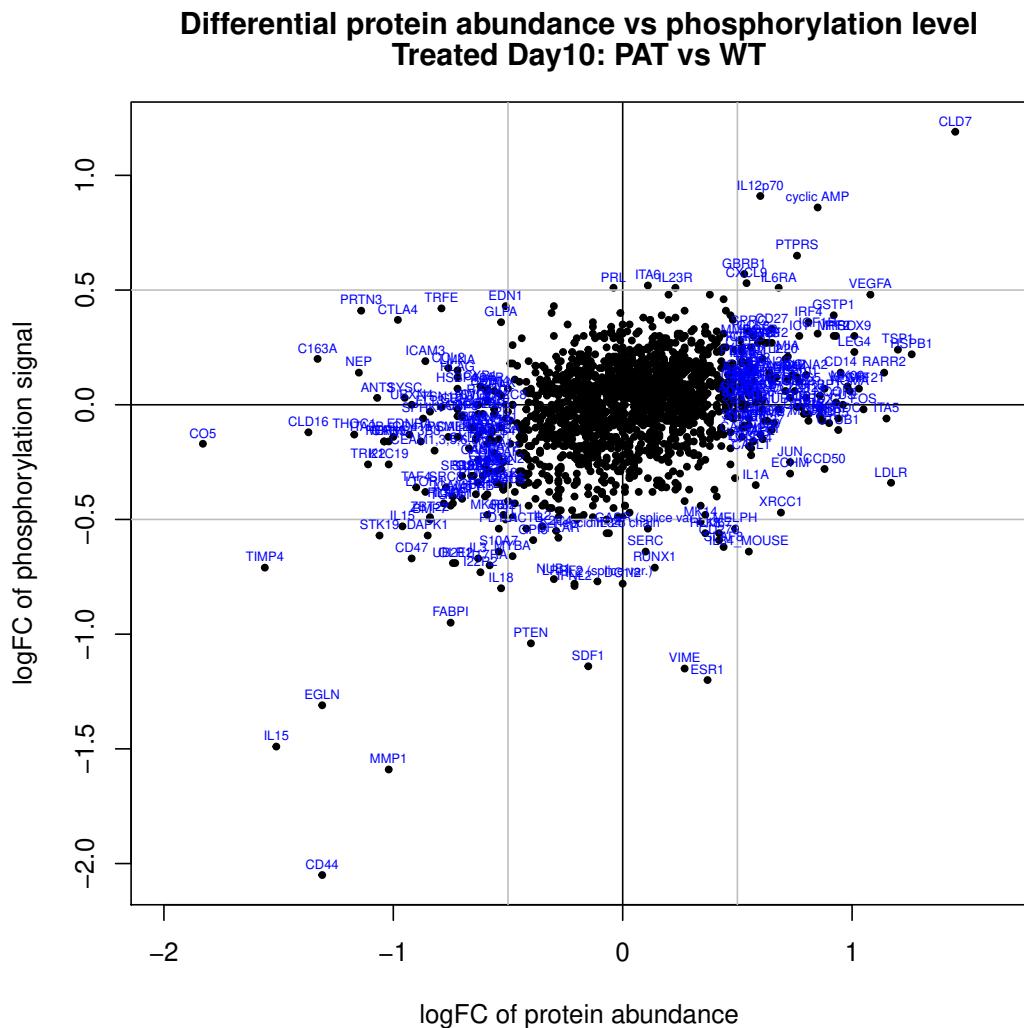

Figure 26: Overview of differences in protein abundance as well as phosphorylation levels between PAT-treated Day10 and WT-treated Day10. Proteins with a positive logFC protein (x-axis) were higher abundant in PAT-treated Day10, while proteins with a negative logFC protein were higher abundant in WT-treated Day10. For proteins with a postive logFC phos (y-axis) higher phosphorylation signals were obtained in PAT-treated Day10. For proteins with a negative logFC phos higher phosphorylation signals were obtained in WT-treated Day10.

4 Results of protein phosphorylation analysis

Table 14: Proteins with differential phosphorylation in PAT-treated Day10 and WT-treated Day10. Proteins with a positive logFC value were more phosphorylated in PAT-treated Day10, proteins with a negative value in WT-treated Day10. In addition, p values adjusted for multiple testing are listed. The Uniprot-Identifier links to the Uniprot-Entry.

Protein	AntibodyID	Uniprot-Entry-Name	Uniprot-Entry	HGNC	logFC	AveExp	adj.P.Val
MMP1	ab2484	MMP1_HUMAN	P03956	MMP1	-1.59	9.00	4.0e-03
CD44	ab1437	CD44_HUMAN	P16070	CD44	-2.05	11.70	1.9e-04

4.2.5 Treated Day20: PAT vs WT

Between PAT-treated Day20 and WT-treated Day20, 10 antibodies recorded a differential protein phosphorylation. The results of the statistical analysis are summarised in the volcano plot (Figure 27) and listed in Table 15. Furthermore, an overview of proteins with differential abundance as well as phosphorylation levels is presented in Figure 28.

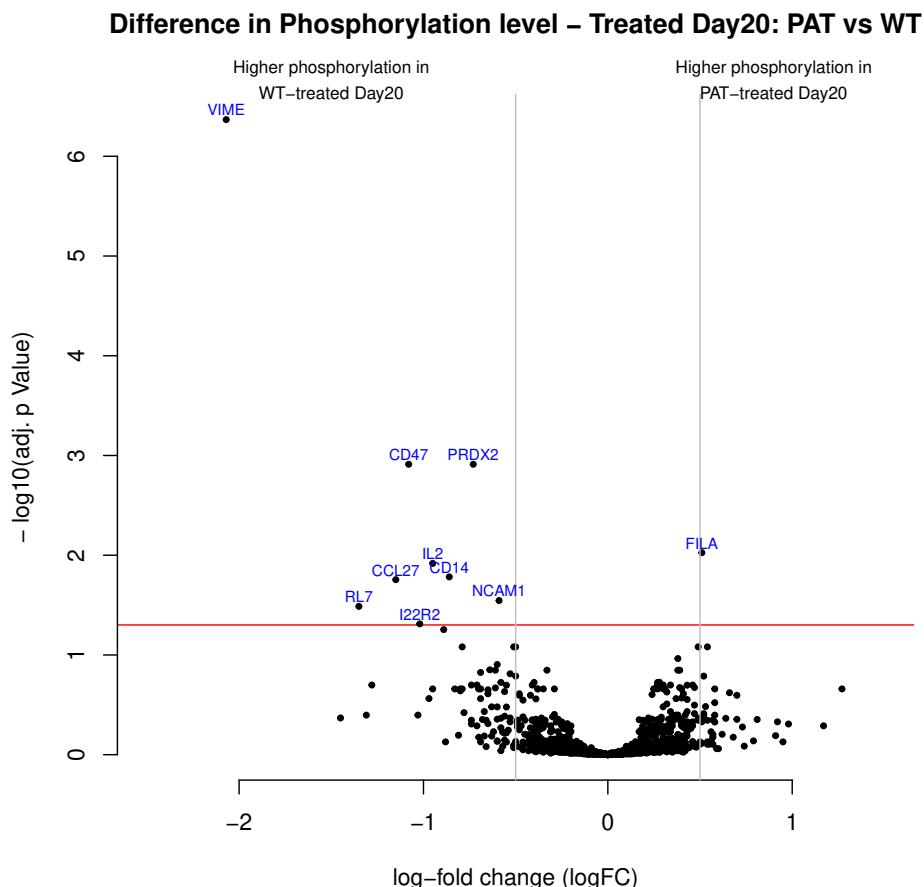

Figure 27: Several proteins exhibited distinct phosphorylation variations in PAT-treated Day20 and WT-treated Day20. The volcano plot visualises the p values (adjusted for multiple testing) and corresponding log-fold changes (logFC). A significance level of adj. p Value = 0.05 is indicated as a horizontal red line. The logFC cutoffs are indicated as vertical lines. Proteins with a positive logFC were more phosphorylated in PAT-treated Day20, proteins with a negative value in WT-treated Day20.

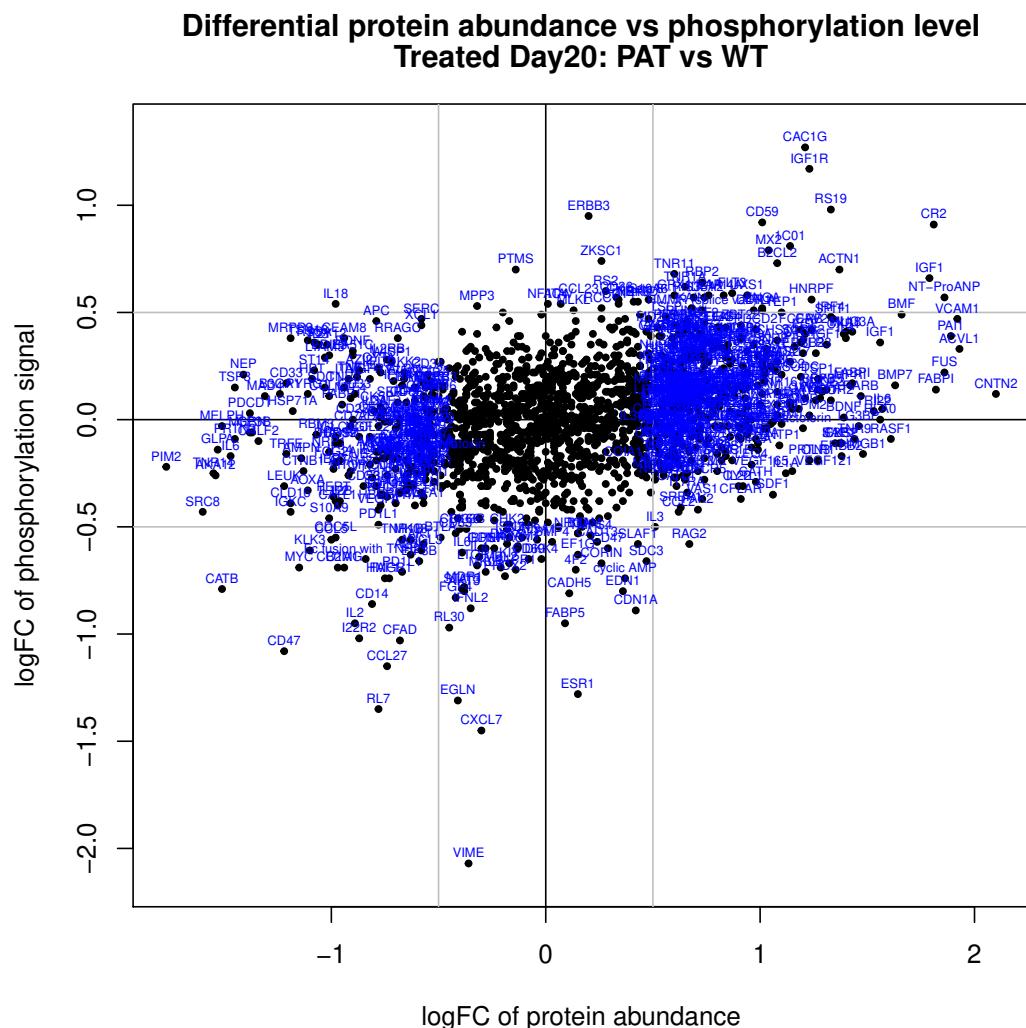

Figure 28: Overview of differences in protein abundance as well as phosphorylation levels between PAT-treated Day20 and WT-treated Day20. Proteins with a positive logFC protein (x-axis) were higher abundant in PAT-treated Day20, while proteins with a negative logFC protein were higher abundant in WT-treated Day20. For proteins with a positive logFC phos (y-axis) higher phosphorylation signals were obtained in PAT-treated Day20. For proteins with a negative logFC phos higher phosphorylation signals were obtained in WT-treated Day20.

4 Results of protein phosphorylation analysis

Table 15: Proteins with differential phosphorylation in PAT-treated Day20 and WT-treated Day20. Proteins with a positive logFC value were more phosphorylated in PAT-treated Day20, proteins with a negative value in WT-treated Day20. In addition, p values adjusted for multiple testing are listed. 4.2.6 Treated Day30: PAT vs WT

Between PAT-treated Day30 and WT-treated Day30, 125 antibodies recorded a differential protein phosphorylation. The results of the statistical analysis are summarised in the volcano plot (Figure 29) and listed in Table 16. Furthermore, an overview of proteins with differential abundance as well as phosphorylation levels is presented in Figure 30.

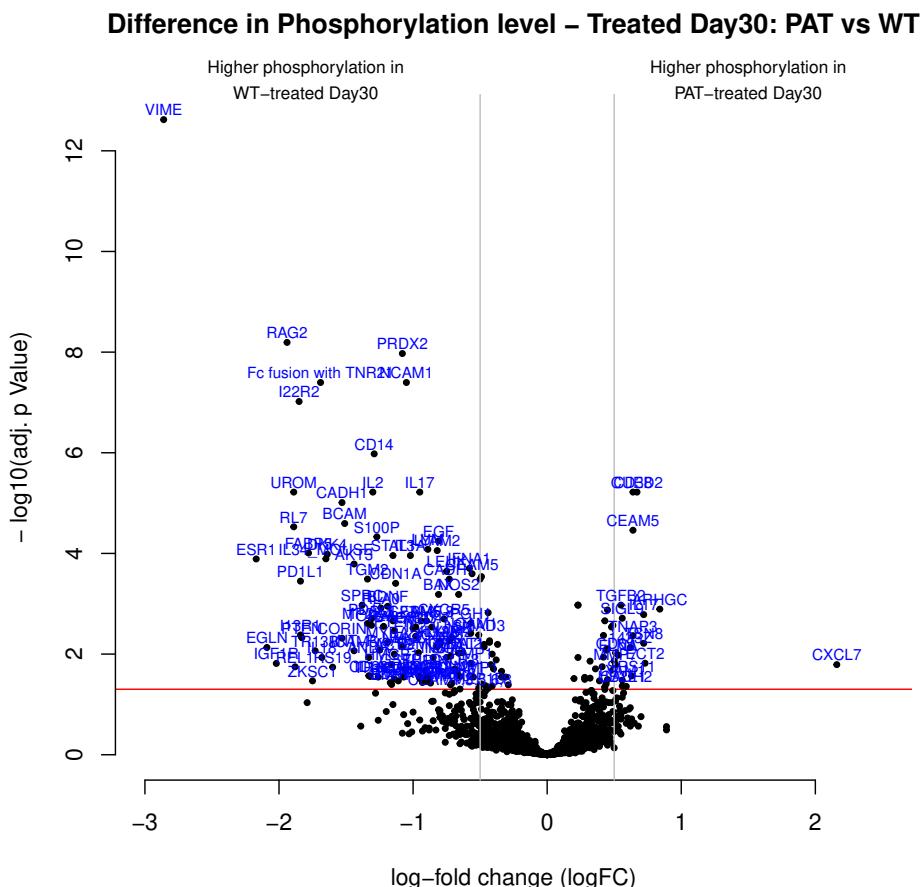

Figure 29: Several proteins exhibited distinct phosphorylation variations in PAT-treated Day30 and WT-treated Day30. The volcano plot visualises the p values (adjusted for multiple testing) and corresponding log-fold changes (logFC). A significance level of adj. p Value = 0.05 is indicated as a horizontal red line. The logFC cutoffs are indicated as vertical lines. Proteins with a positive logFC were more phosphorylated in PAT-treated Day30, proteins with a negative value in WT-treated Day30.

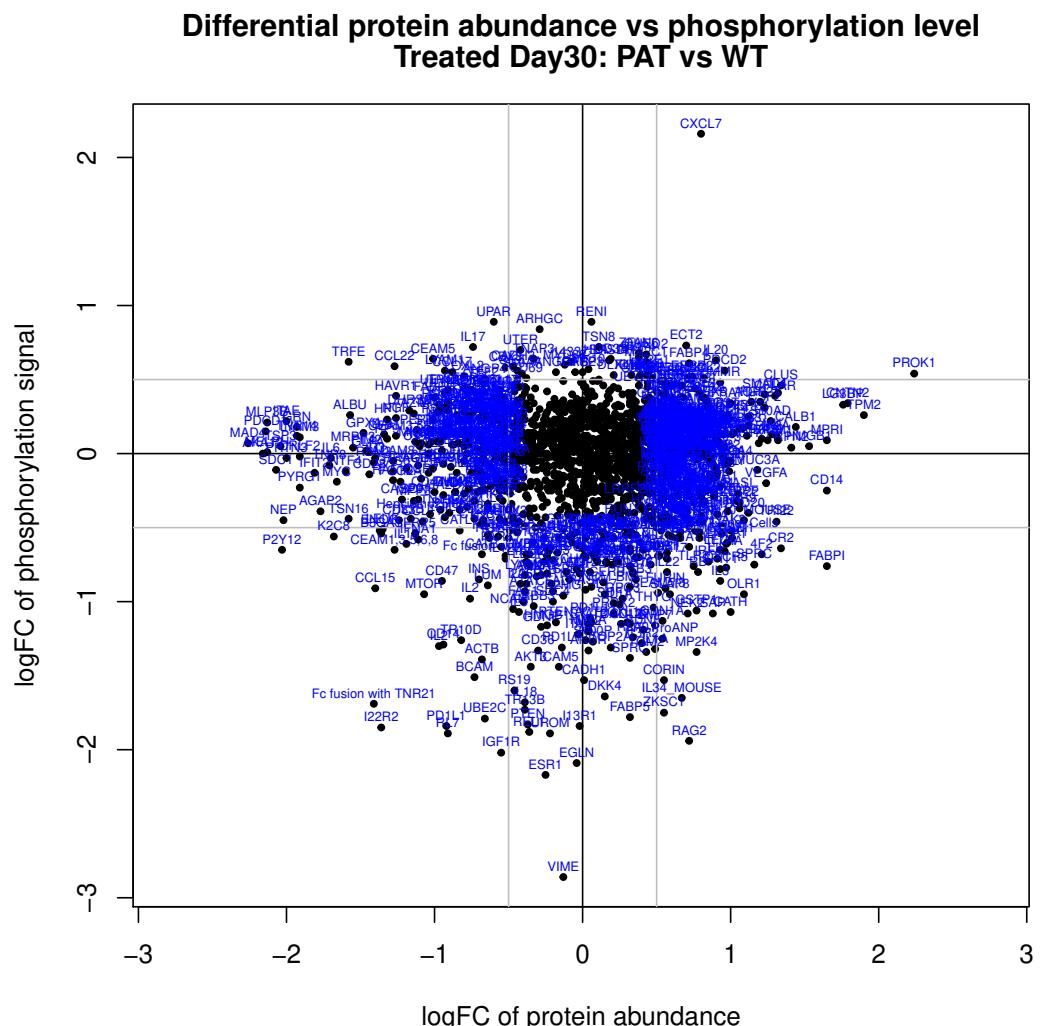

Figure 30: Overview of differences in protein abundance as well as phosphorylation levels between PAT-treated Day30 and WT-treated Day30. Proteins with a positive logFC protein (x-axis) were higher abundant in PAT-treated Day30, while proteins with a negative logFC protein were higher abundant in WT-treated Day30. For proteins with a positive logFC phos (y-axis) higher phosphorylation signals were obtained in PAT-treated Day30. For proteins with a negative logFC phos higher phosphorylation signals were obtained in WT-treated Day30.

4.2.7 PAT Day10: Treated vs Untreated

Between PAT-treated Day10 and PAT-untreated Day10, one antibody recorded a differential protein phosphorylation. The results of the statistical analysis are summarised in the volcano plot (Figure 31) and listed in Table 17. Furthermore, an overview of proteins with differential abundance as well as phosphorylation levels is presented in Figure 32.

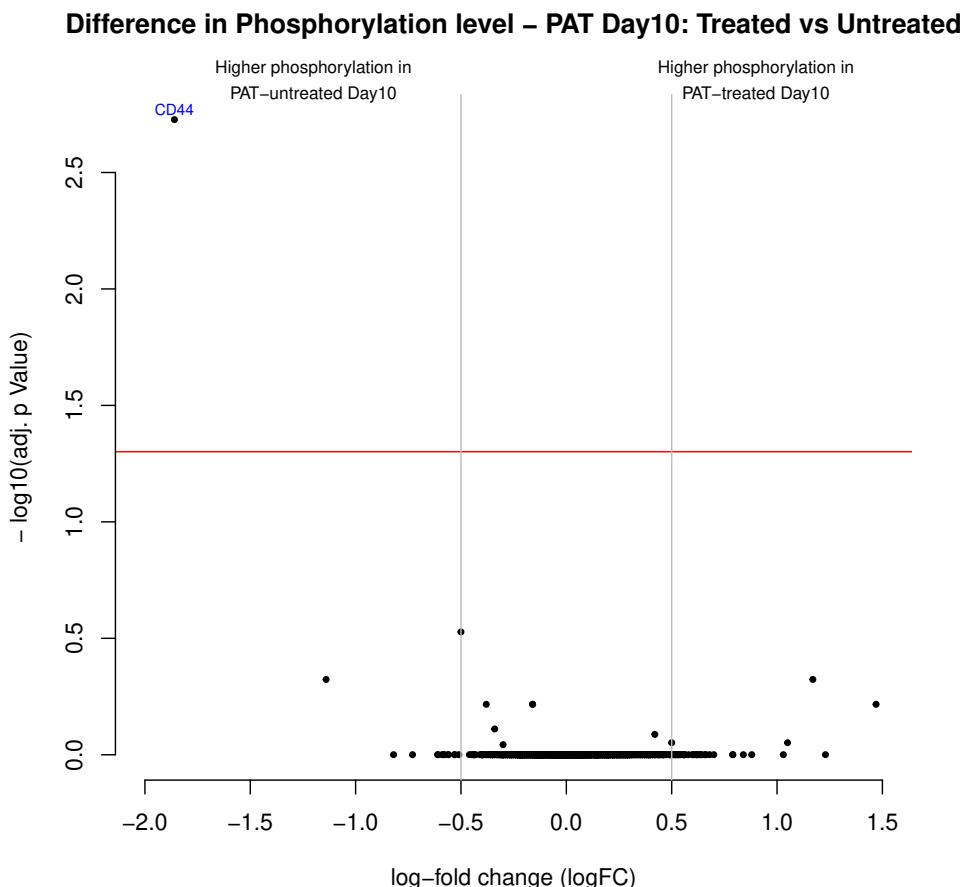

Figure 31: Several proteins exhibited distinct phosphorylation variations in PAT-treated Day10 and PAT-untreated Day10. The volcano plot visualises the p values (adjusted for multiple testing) and corresponding log-fold changes (logFC). A significance level of adj. p Value = 0.05 is indicated as a horizontal red line. The logFC cutoffs are indicated as vertical lines. Proteins with a positive logFC were more phosphorylated in PAT-treated Day10, proteins with a negative value in PAT-untreated Day10.

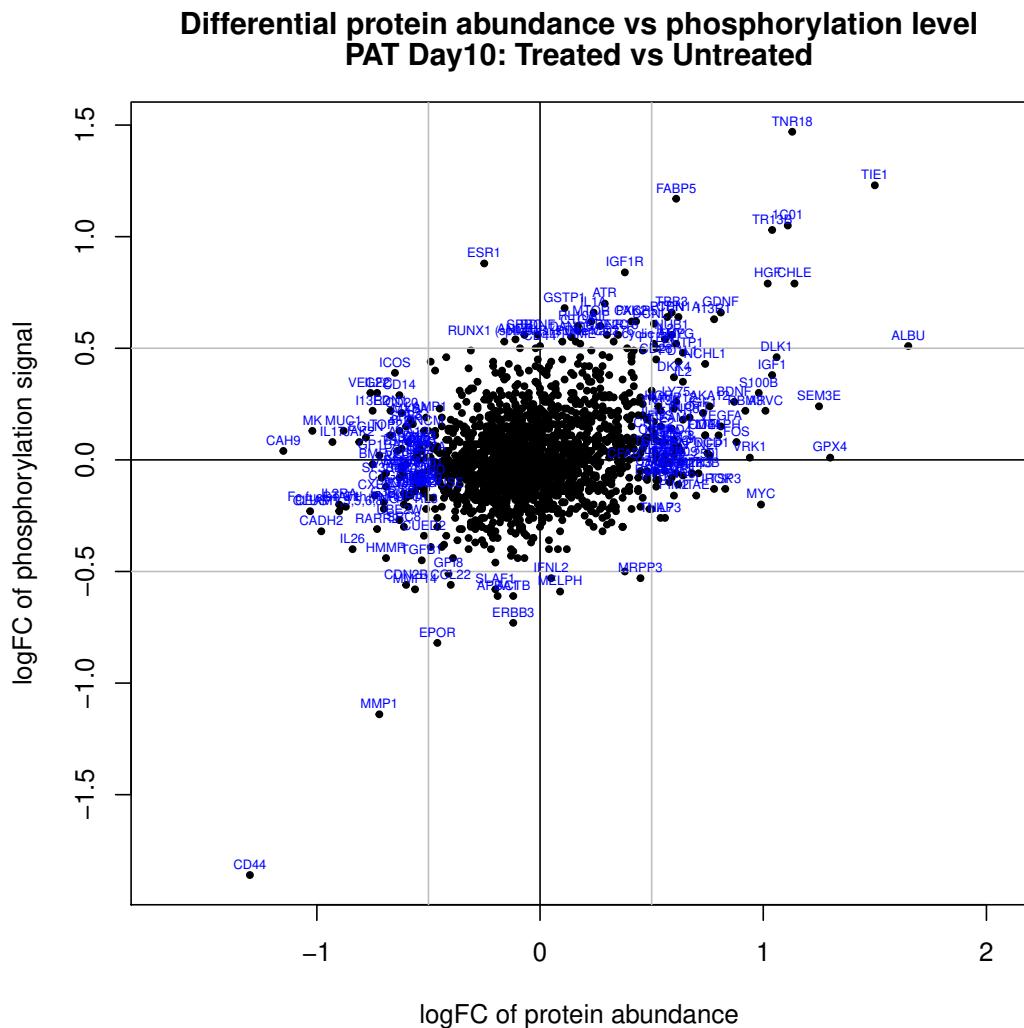

Figure 32: Overview of differences in protein abundance as well as phosphorylation levels between PAT-treated Day10 and PAT-untreated Day10. Proteins with a positive logFC protein (x-axis) were higher abundant in PAT-treated Day10, while proteins with a negative logFC protein were higher abundant in PAT-untreated Day10. For proteins with a postive logFC phos (y-axis) higher phosphorylation signals were obtained in PAT-treated Day10. For proteins with a negative logFC phos higher phosphorylation signals were obtained in PAT-untreated Day10.

4 Results of protein phosphorylation analysis

Table 17: Proteins with differential phosphorylation in PAT-treated Day10 and PAT-untreated Day10. Proteins with a positive logFC value were more phosphorylated in PAT-treated Day10, proteins with a negative value in PAT-untreated Day10. In addition, p values adjusted for multiple testing are listed. The Uniprot-Identifier links to the Uniprot-Entry.

Protein	AntibodyID	Uniprot-Entry-Name	Uniprot-Entry	HGNC	logFC	AveExp	adj.P.Val
CD44	ab1437	CD44_HUMAN	P16070	CD44	-1.86	11.70	1.9e-03

4.2.8 PAT Day20: Treated vs Untreated

Between PAT-treated Day20 and PAT-untreated Day20, no antibody recorded a differential protein phosphorylation. The results of the statistical analysis are summarised in the volcano plot (Figure 33). Furthermore, an overview of proteins with differential abundance as well as phosphorylation levels is presented in Figure 34.

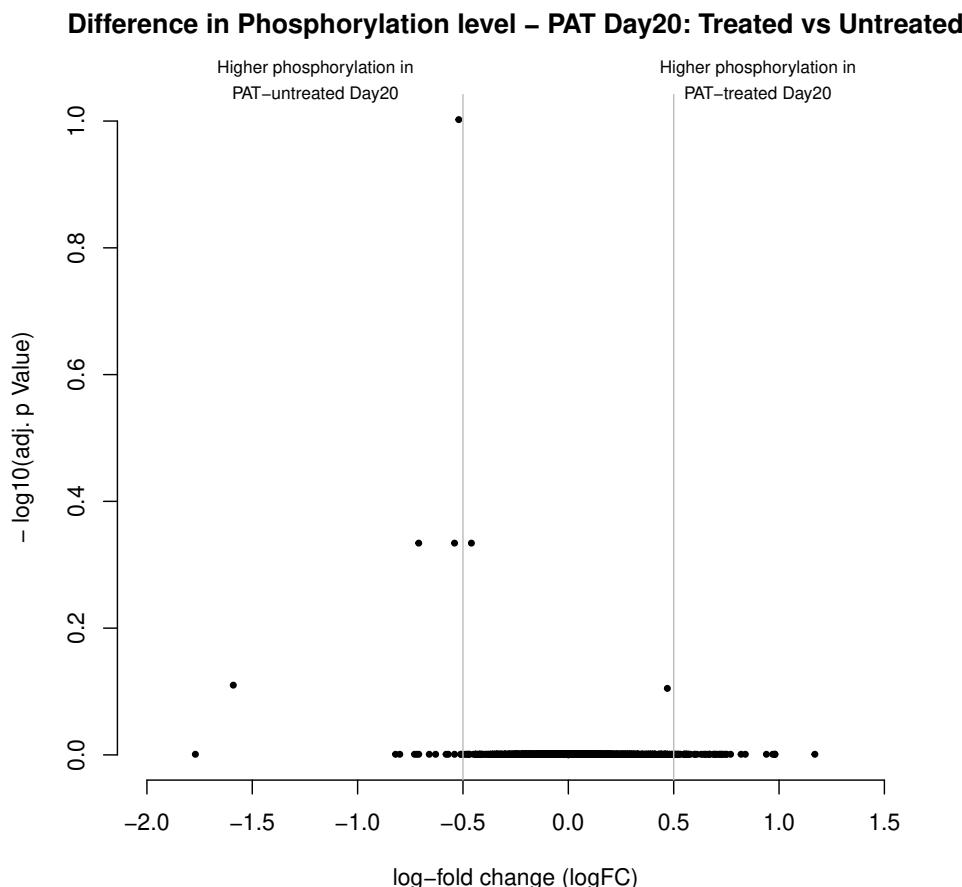

Figure 33: Several proteins exhibited distinct phosphorylation variations in PAT-treated Day20 and PAT-untreated Day20. The volcano plot visualises the p values (adjusted for multiple testing) and corresponding log-fold changes (logFC). A significance level of adj. p Value = 0.05 is indicated as a horizontal red line. The logFC cutoffs are indicated as vertical lines. Proteins with a positive logFC were more phosphorylated in PAT-treated Day20, proteins with a negative value in PAT-untreated Day20.

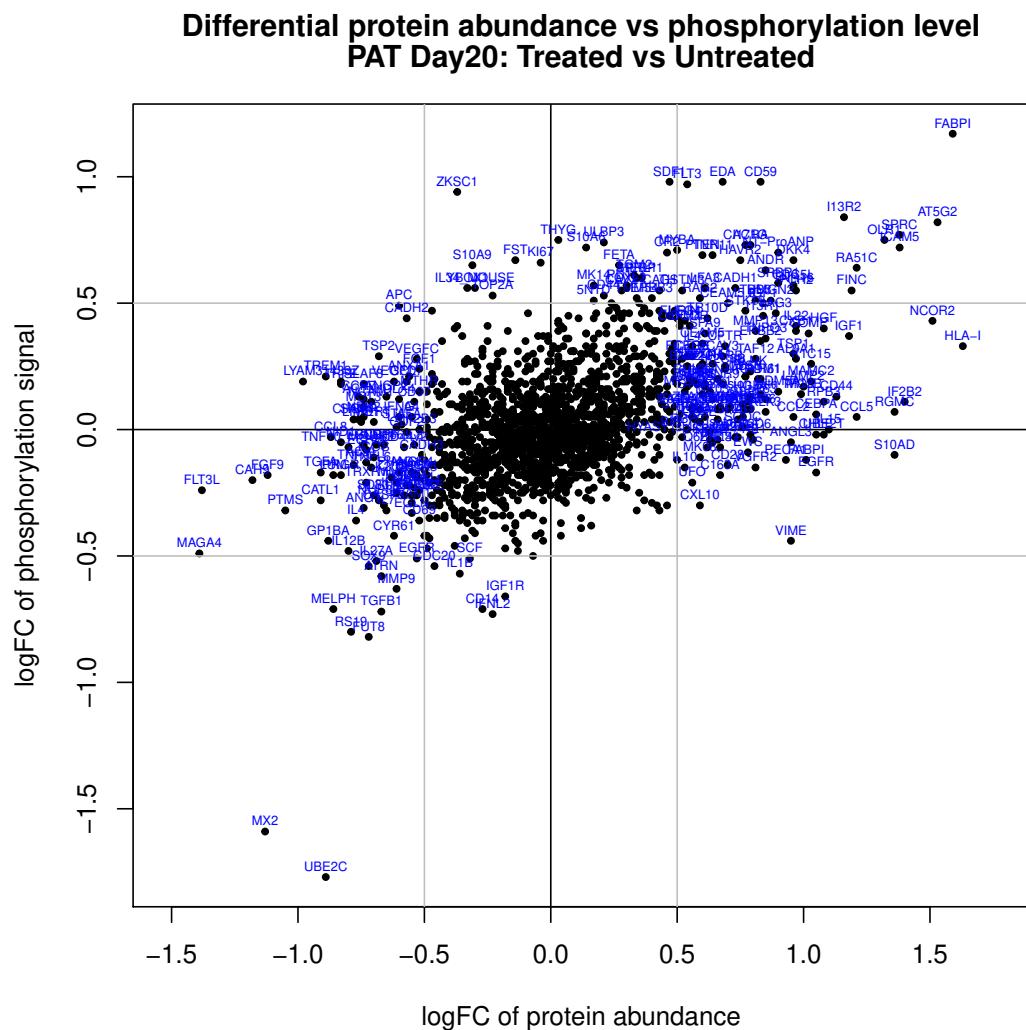

Figure 34: Overview of differences in protein abundance as well as phosphorylation levels between PAT-treated Day20 and PAT-untreated Day20. Proteins with a positive logFC protein (x-axis) were higher abundant in PAT-treated Day20, while proteins with a negative logFC protein were higher abundant in PAT-untreated Day20. For proteins with a positive logFC phos (y-axis) higher phosphorylation signals were obtained in PAT-treated Day20. For proteins with a negative logFC phos higher phosphorylation signals were obtained in PAT-untreated Day20.

4.2.9 PAT Day30: Treated vs Untreated

Between PAT-treated Day30 and PAT-untreated Day30, no antibody recorded a differential protein phosphorylation. The results of the statistical analysis are summarised in the volcano plot (Figure 35). Furthermore, an overview of proteins with differential abundance as well as phosphorylation levels is presented in Figure 36.

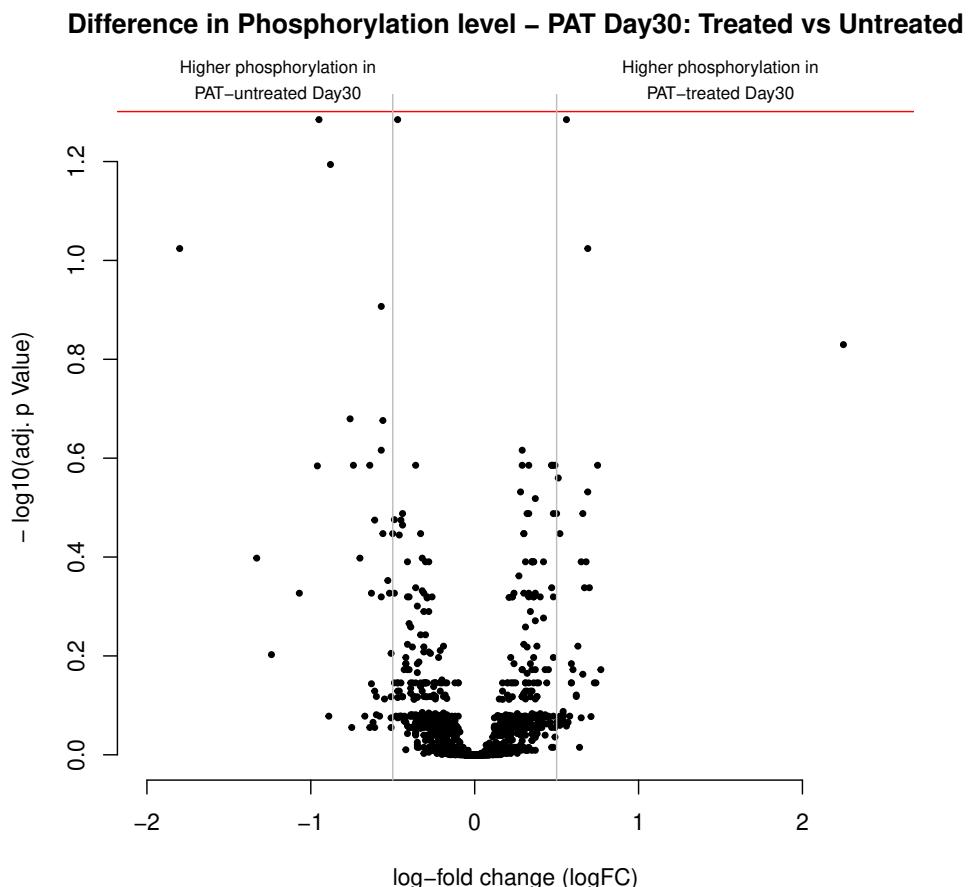

Figure 35: Several proteins exhibited distinct phosphorylation variations in PAT-treated Day30 and PAT-untreated Day30. The volcano plot visualises the p values (adjusted for multiple testing) and corresponding log-fold changes (logFC). A significance level of adj. p Value = 0.05 is indicated as a horizontal red line. The logFC cutoffs are indicated as vertical lines. Proteins with a positive logFC were more phosphorylated in PAT-treated Day30, proteins with a negative value in PAT-untreated Day30.

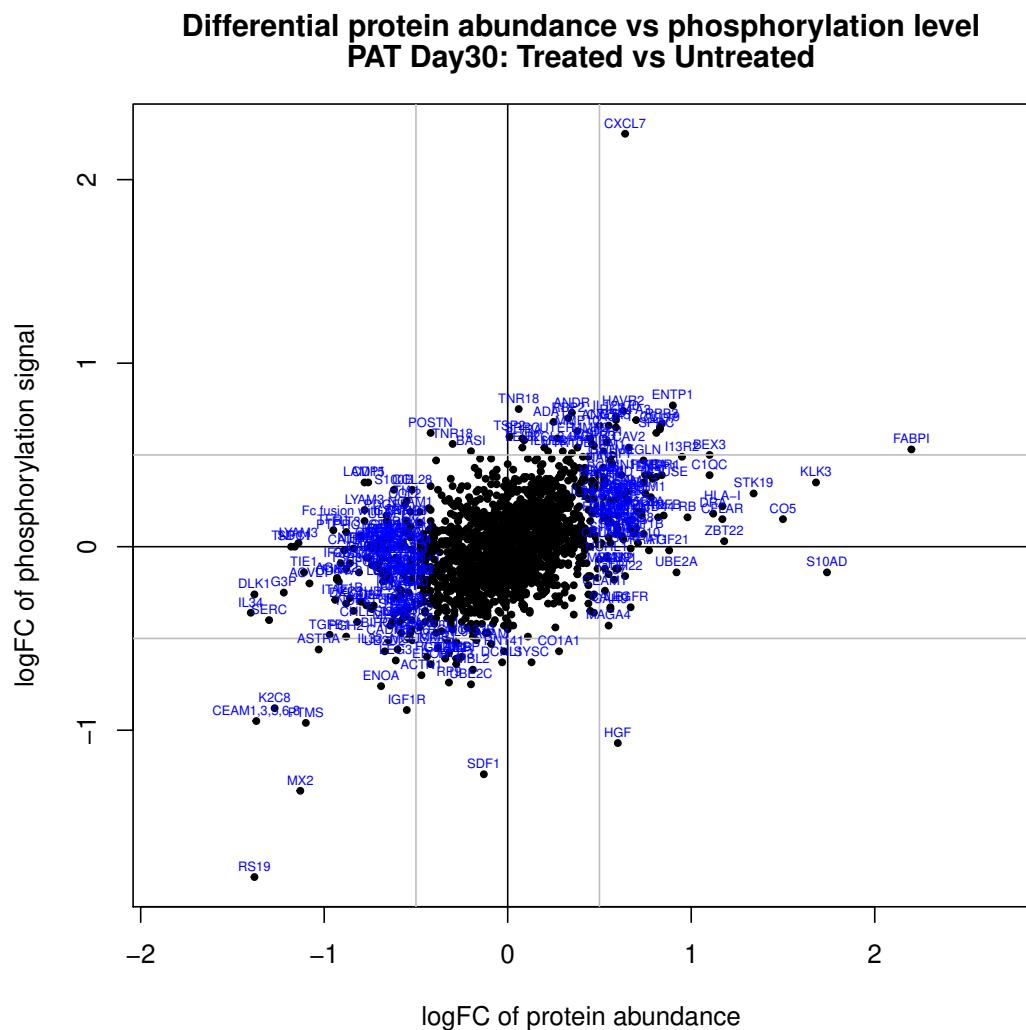

Figure 36: Overview of differences in protein abundance as well as phosphorylation levels between PAT-treated Day30 and PAT-untreated Day30. Proteins with a positive logFC protein (x-axis) were higher abundant in PAT-treated Day30, while proteins with a negative logFC protein were higher abundant in PAT-untreated Day30. For proteins with a positive logFC phos (y-axis) higher phosphorylation signals were obtained in PAT-treated Day30. For proteins with a negative logFC phos higher phosphorylation signals were obtained in PAT-untreated Day30.

4.3 Individual protein and phosphorylation levels

For some differential proteins relative protein and phosphorylation levels are presented in Figure 37. To improve the visibility of the selected comparison, only samples belonging to the two samples groups chosen are coloured. All the other samples are in grey. These graphs are only a selection and for example purposes. Graphs for all differentially phosphorylated proteins with all samples coloured according to their respective groups have been provided with the report in a separate file.

4 Results of protein phosphorylation analysis

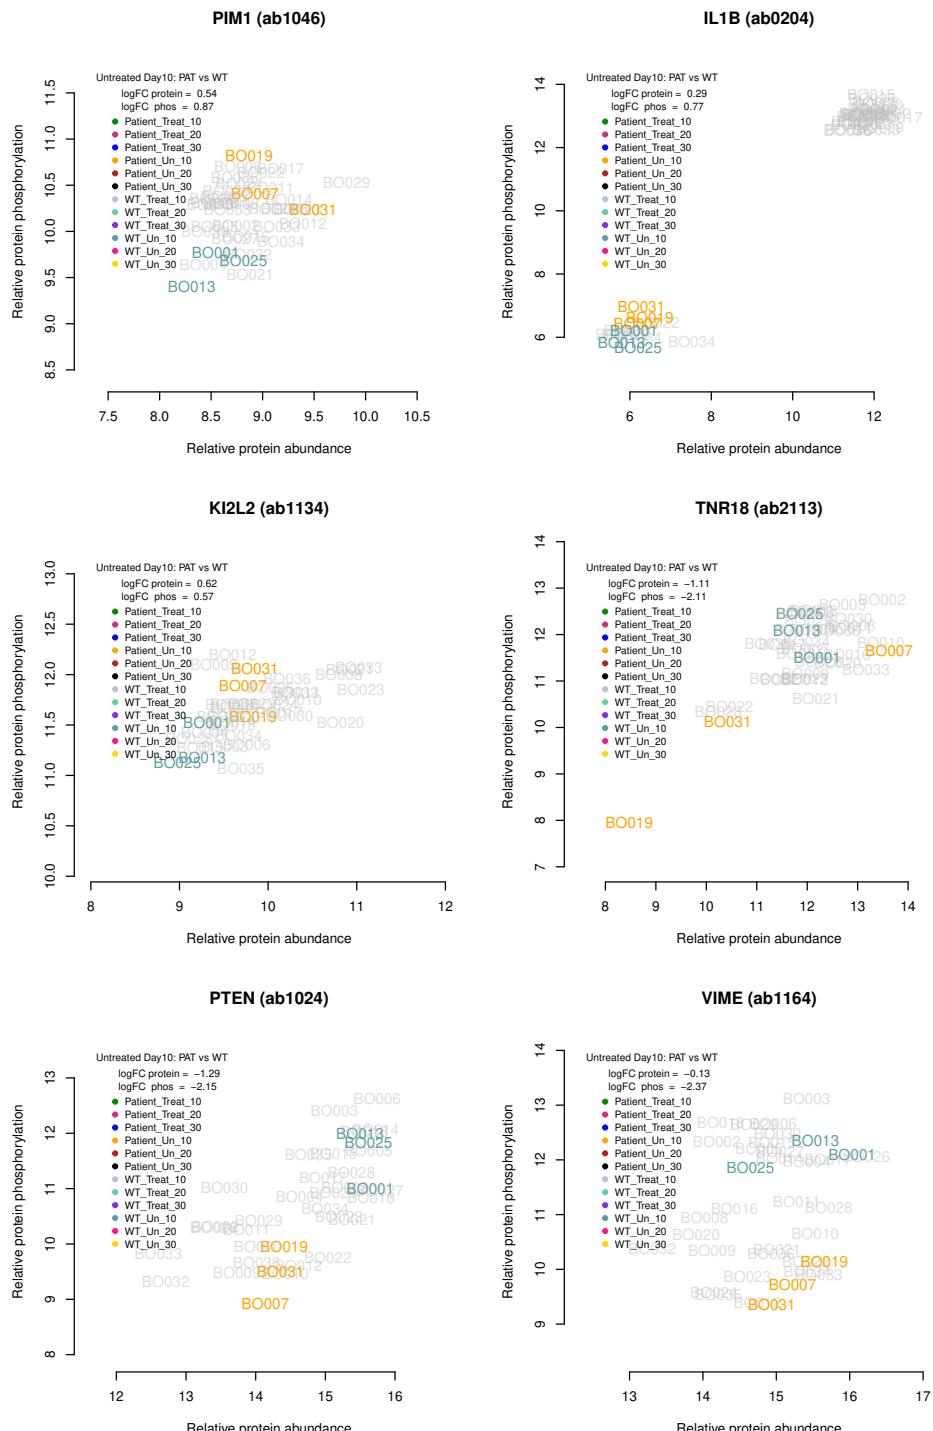

Figure 37: Individual array values for a set of differential proteins. Each sample is measured by four replicate spots per array.

5 Differential protein classification

5.1 Differentially abundant proteins in Untreated Day10: PAT vs WT

The following tables display information about:

- selected KEGG pathways (Table 18)
- selected Reactome pathways (Table 19)

related to differential proteins within the comparison of Untreated Day10: PAT vs WT samples identified in this study.

Table 18: Selected KEGG pathways related to proteins with differential abundance in Untreated Day10: PAT vs WT. The first dot shows the change on protein level, the second on phosphorylation level. Green indicates a higher protein abundance in PAT-untreated Day10, red indicates a higher protein abundance in WT-untreated Day10. Blue indicates a higher phosphorylation abundance in PAT-untreated Day10, orange indicates a higher phosphorylation abundance in WT-untreated Day10. Black indicates no regulation. Yellow indicates higher abundance in PAT-untreated Day10 and WT-untreated Day10 for more than one antibody.

5.2 Differential abundant proteins in Treated Day10: PAT vs WT

The following table displays information about:

- selected Reactome pathways (Table 20)

related to differential proteins within the comparison of Treated Day10: PAT vs WT samples identified in this study.

Table 20: Selected Reactome pathways related to proteins with differential abundance in Treated Day10: PAT vs WT. The first dot shows the change on protein level, the second on phosphorylation level. Green indicates a higher protein abundance in PAT-treated Day10, red indicates a higher protein abundance in WT-treated Day10. Blue indicates a higher phosphorylation abundance in PAT-treated Day10, orange indicates a higher phosphorylation abundance in WT-treated Day10. Black indicates no regulation. Yellow indicates higher abundance in PAT-treated Day10 and WT-treated Day10 for more than one antibody.

6 Protein interactions

6.1 Protein interactions in Untreated Day10: PAT vs WT

Selected protein-protein interaction analysis using the STRING database (<http://string-db.org>) revealed several direct as well as indirect interactions of the differential proteins within Untreated Day10: PAT vs WT (Figure 38).

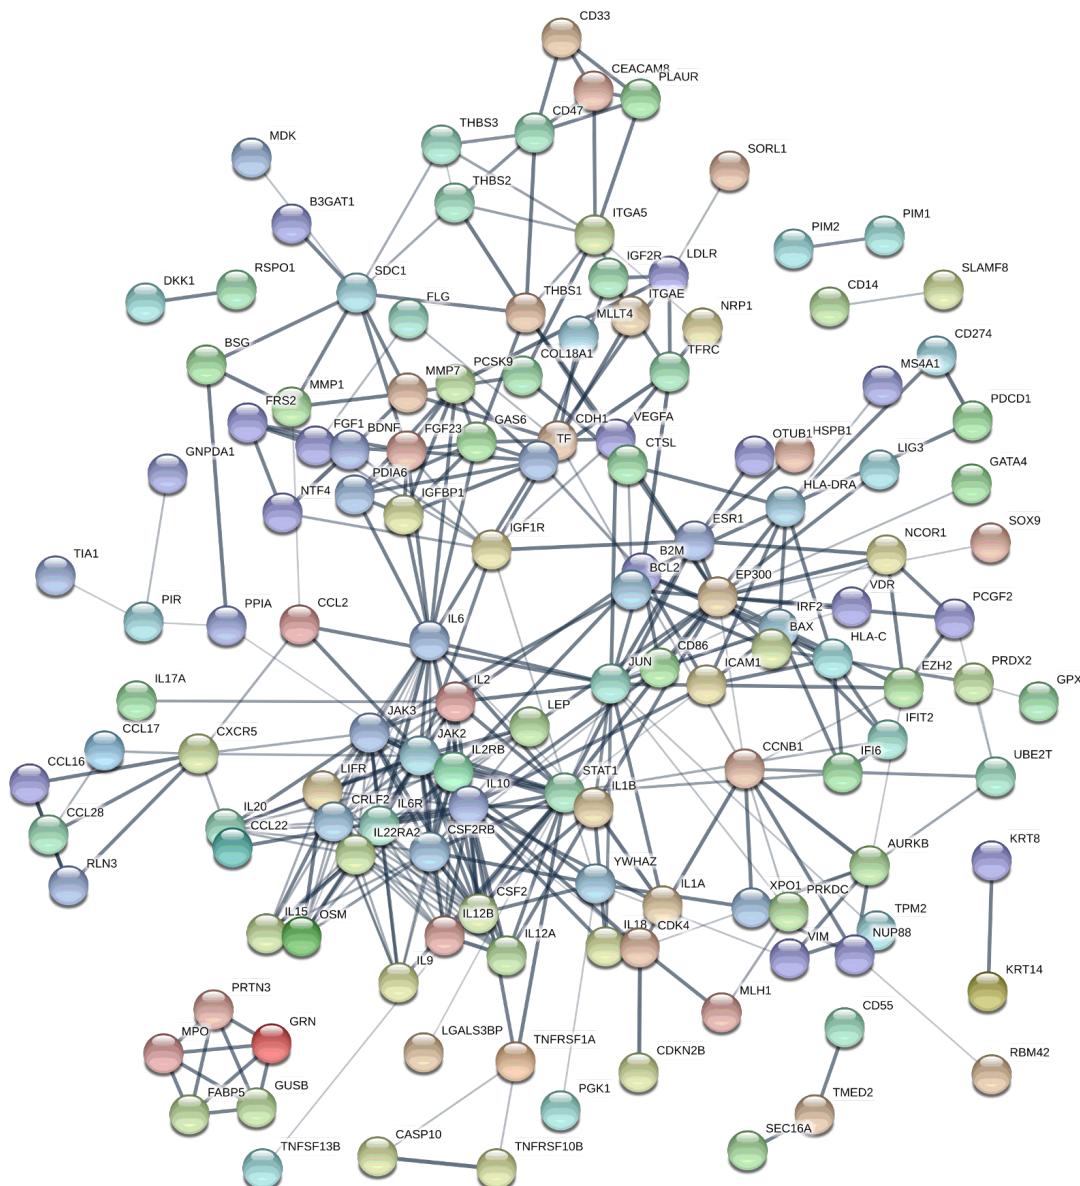

Figure 38: Selected protein interaction analysis of the differential proteins using STRING.

6.2 Protein interactions in Treated Day10: PAT vs WT

Selected protein-protein interaction analysis using the STRING database (<http://string-db.org>) revealed several direct as well as indirect interactions of the differential proteins within Treated Day10: PAT vs WT (Figure 39).

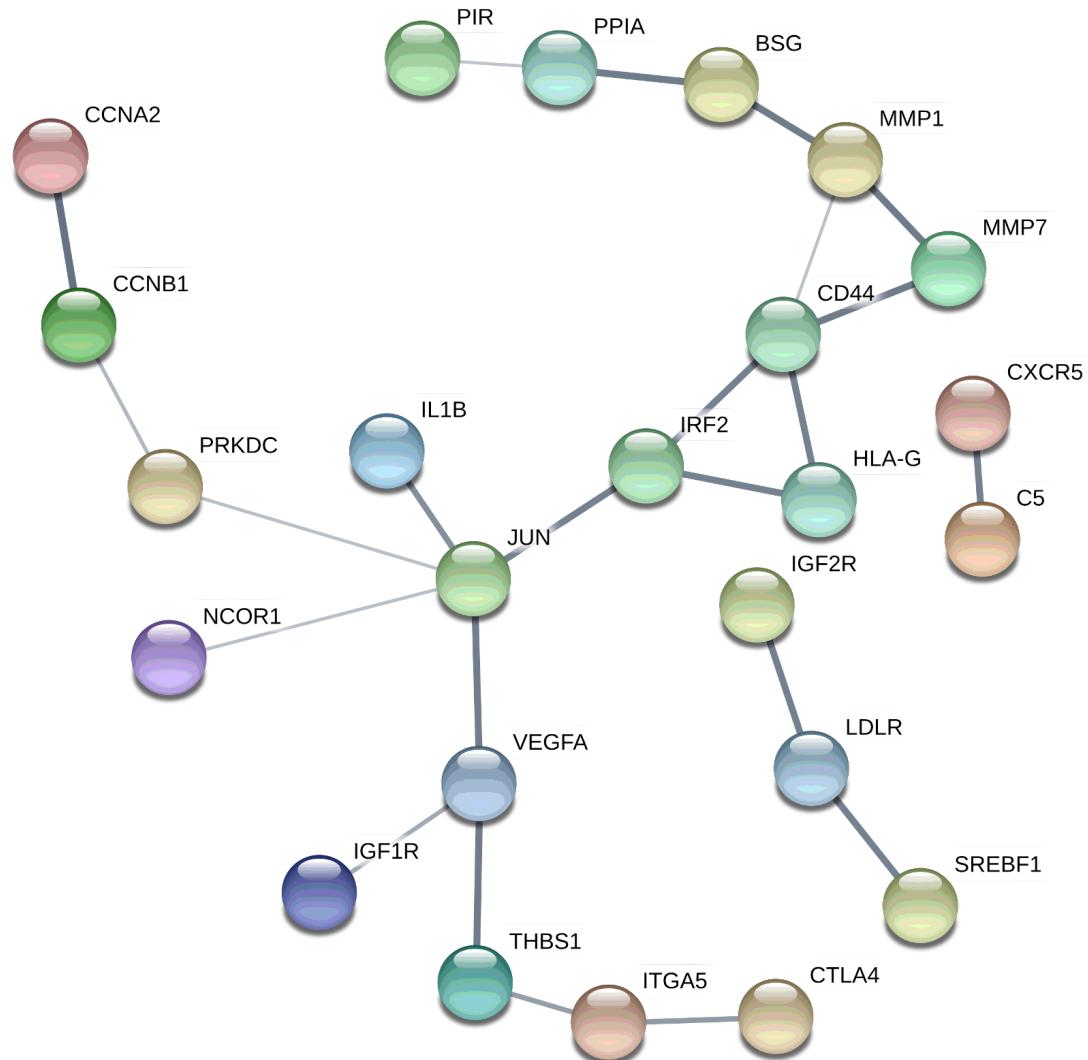

Figure 39: Selected protein interaction analysis of the differential proteins using STRING.
