Luxembourg Centre for Systems Biomedicine

Utilization of the iPSC technology to generate NSCs and neurons

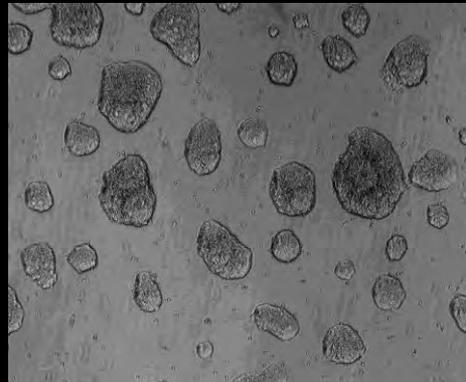

LRRK2
SNCA
VPS35
ATP13A2
Pink1/Parkin

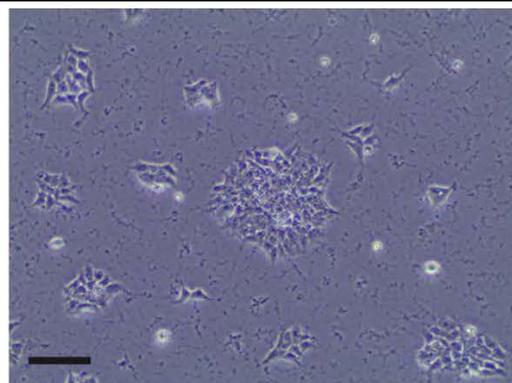

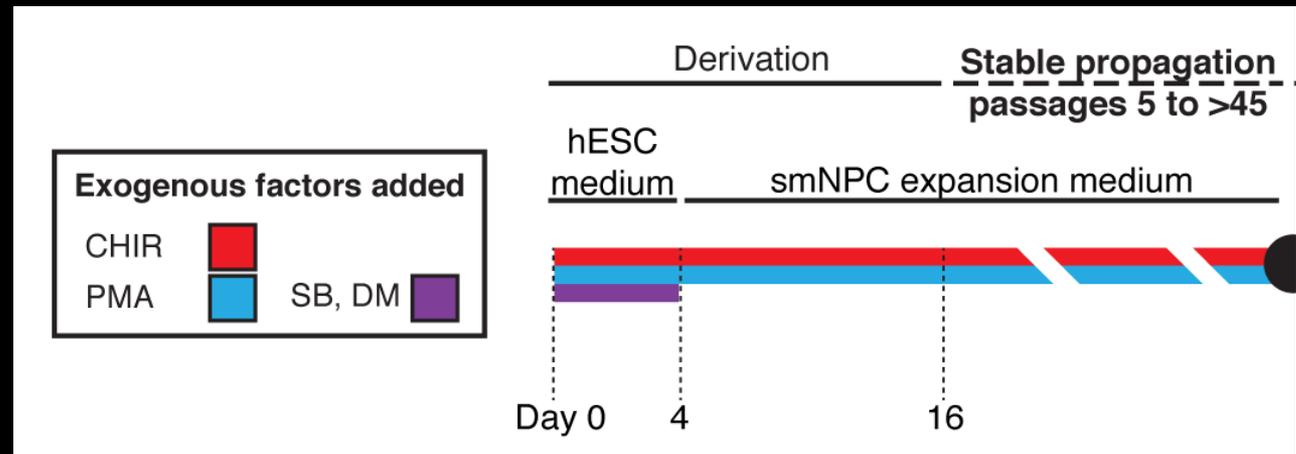

Specification of regional identity

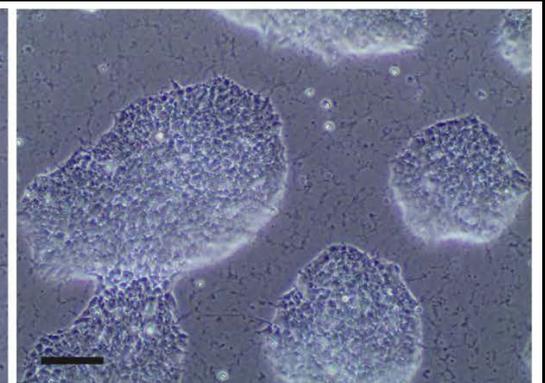

Derivation of neuroepithelial stem cells (NESCs)

hiPSCs

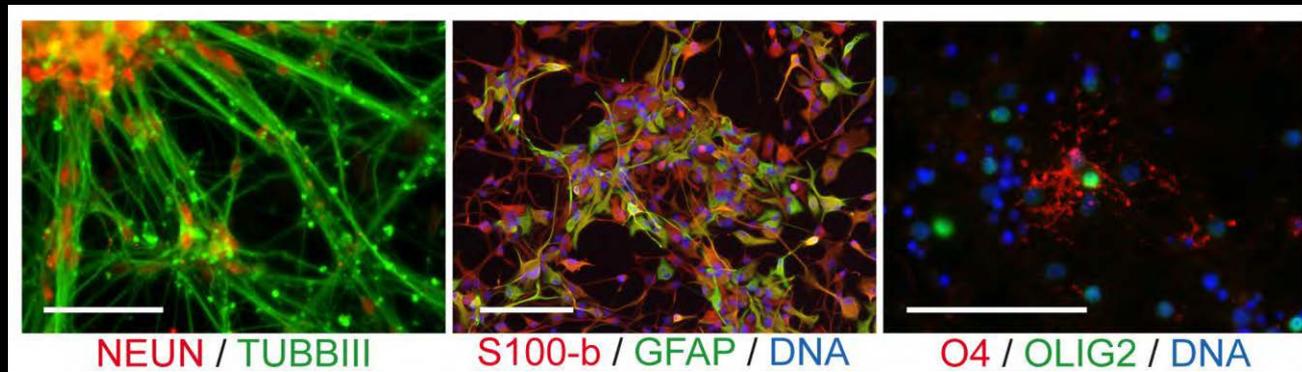

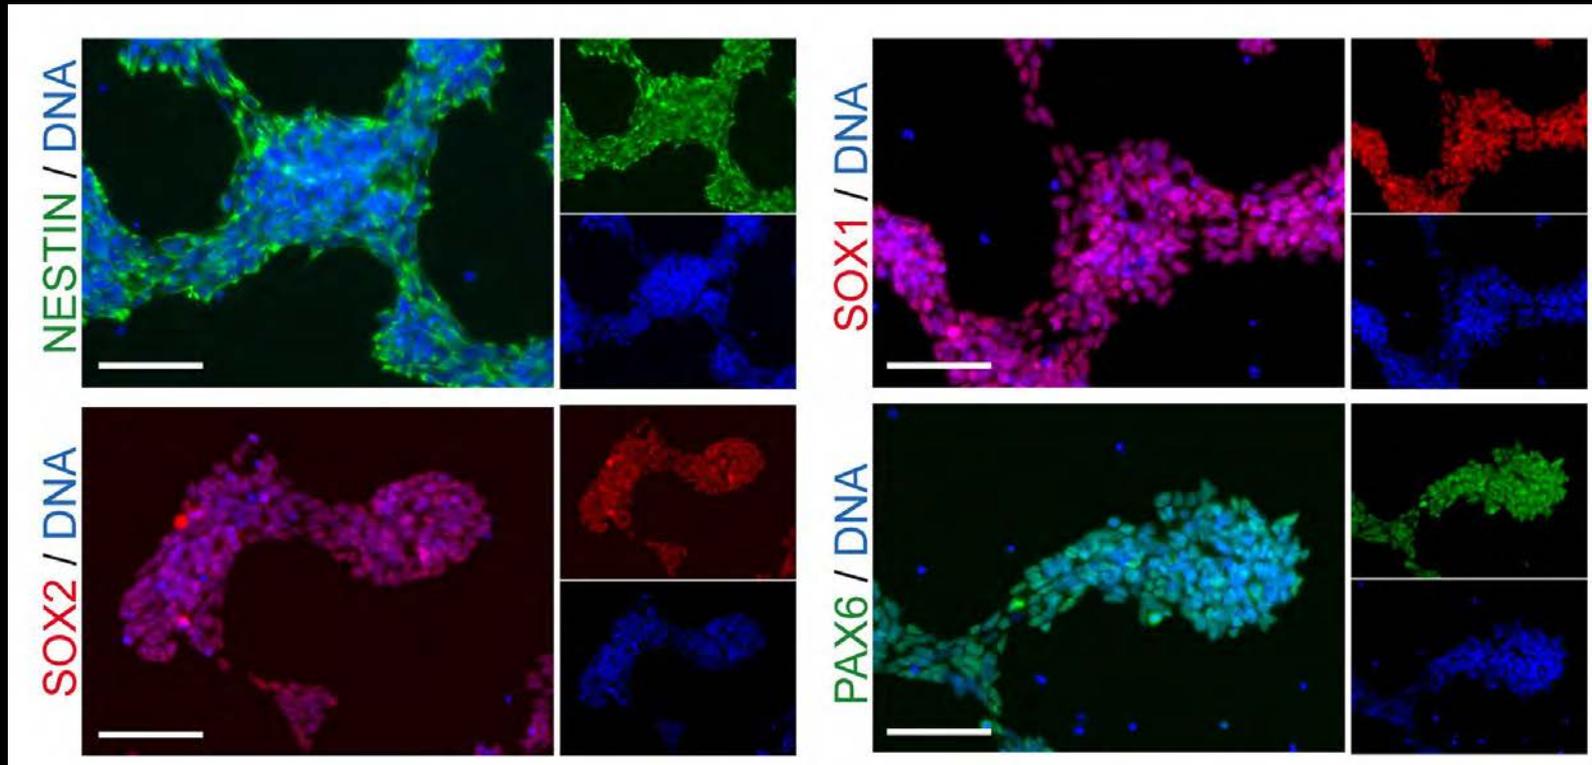

1 day post-plating

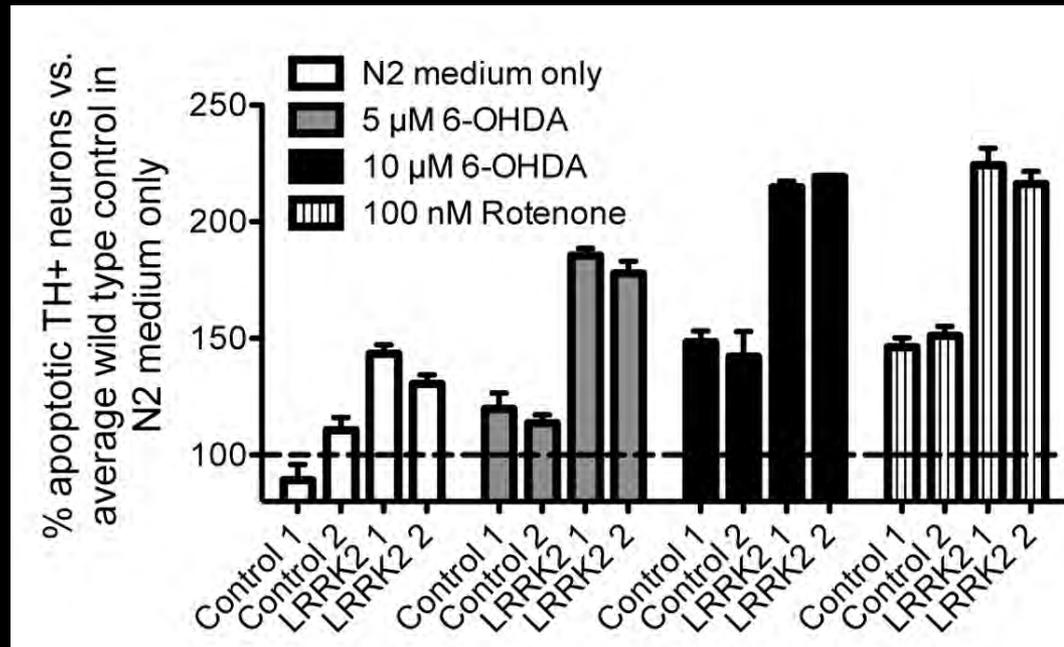

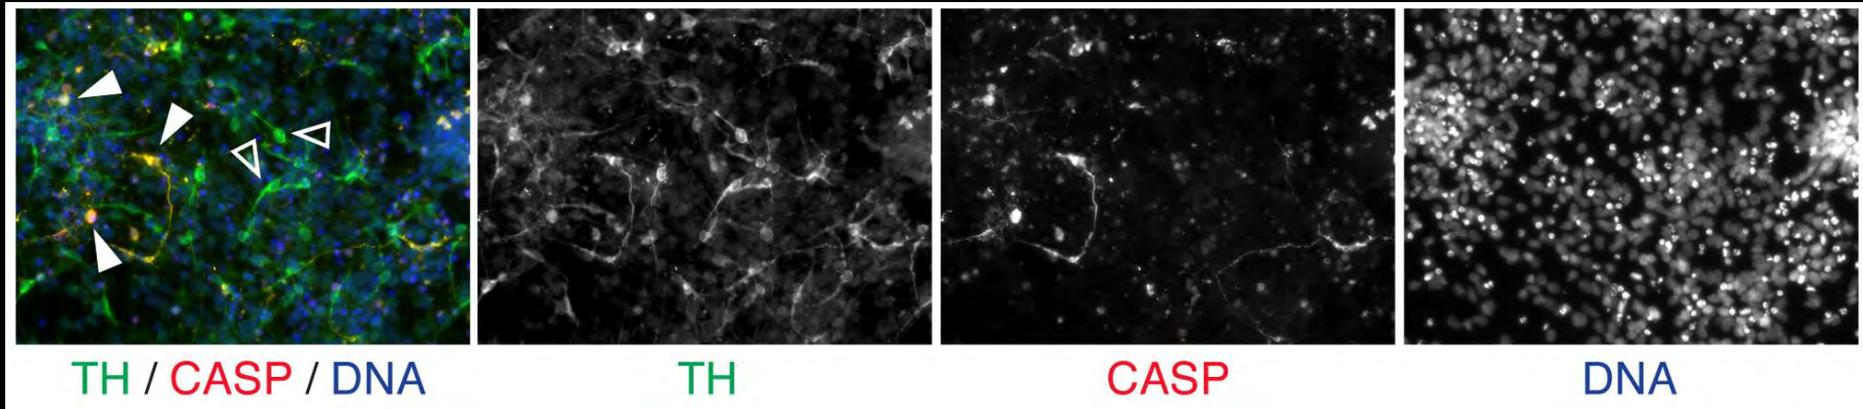

4 days post-plating

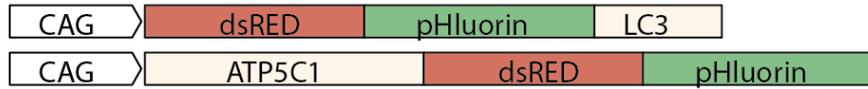

NESCs express early neural markers

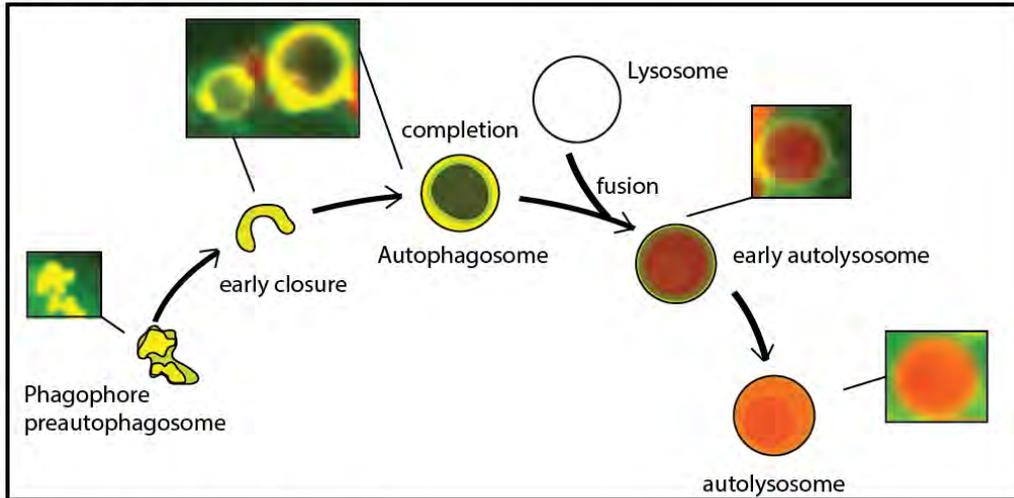

DNs for *in vitro* Parkinson's disease modelling

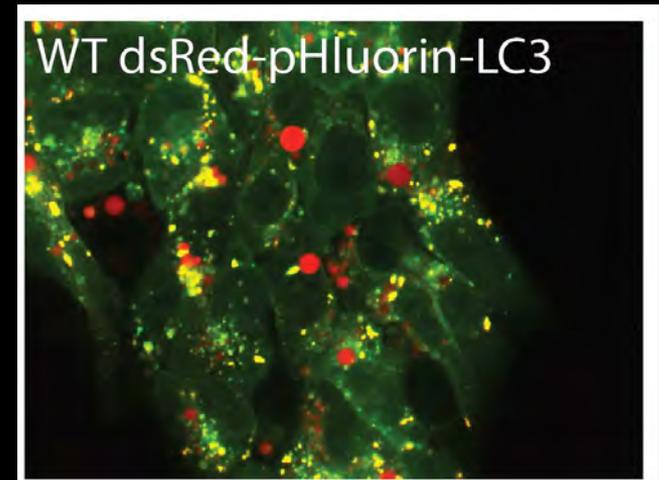

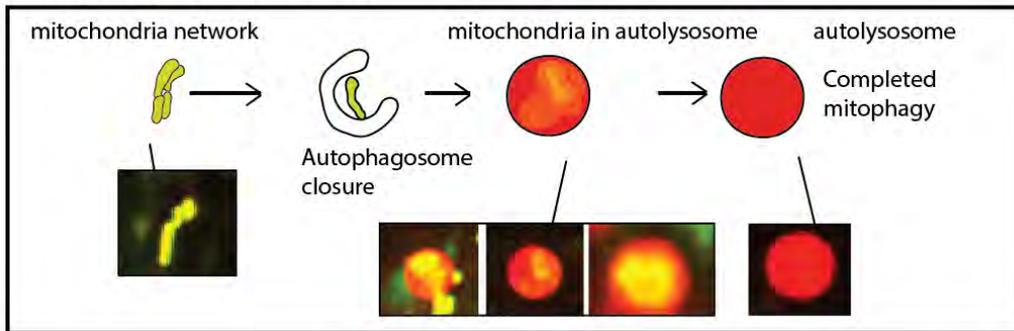

Autophagy sensors

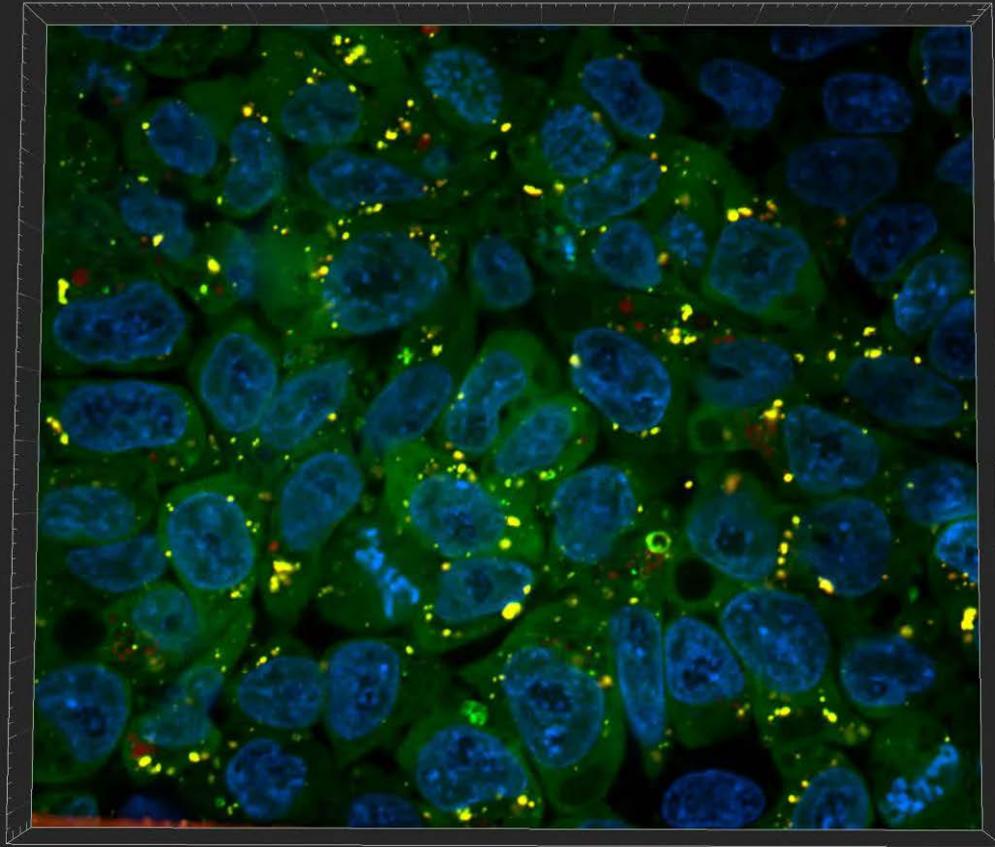

autophagy rosetta-LC3

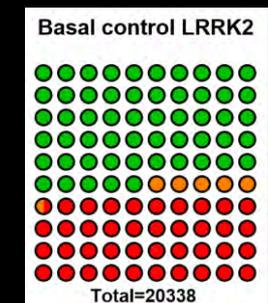

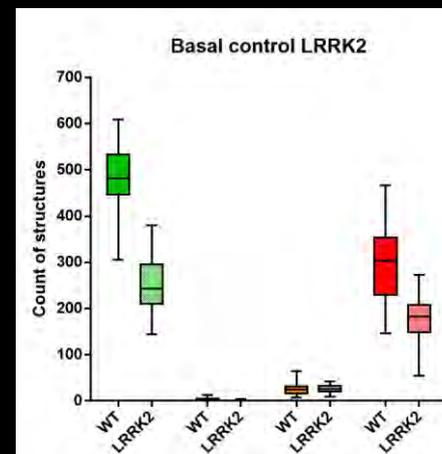

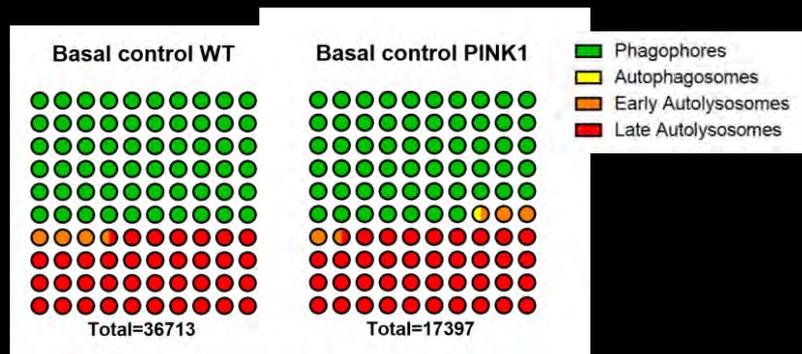

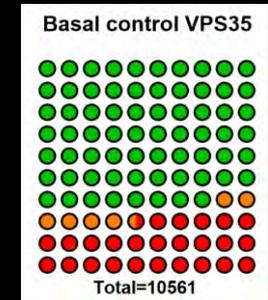

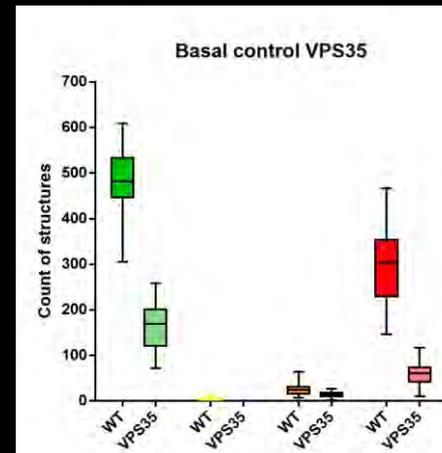

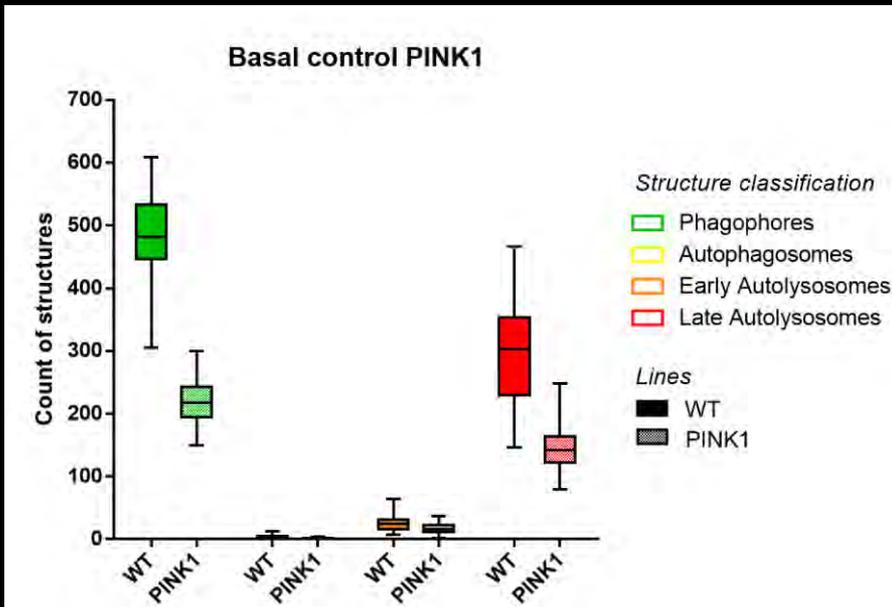

mitophagy ATP5C1-rosetta

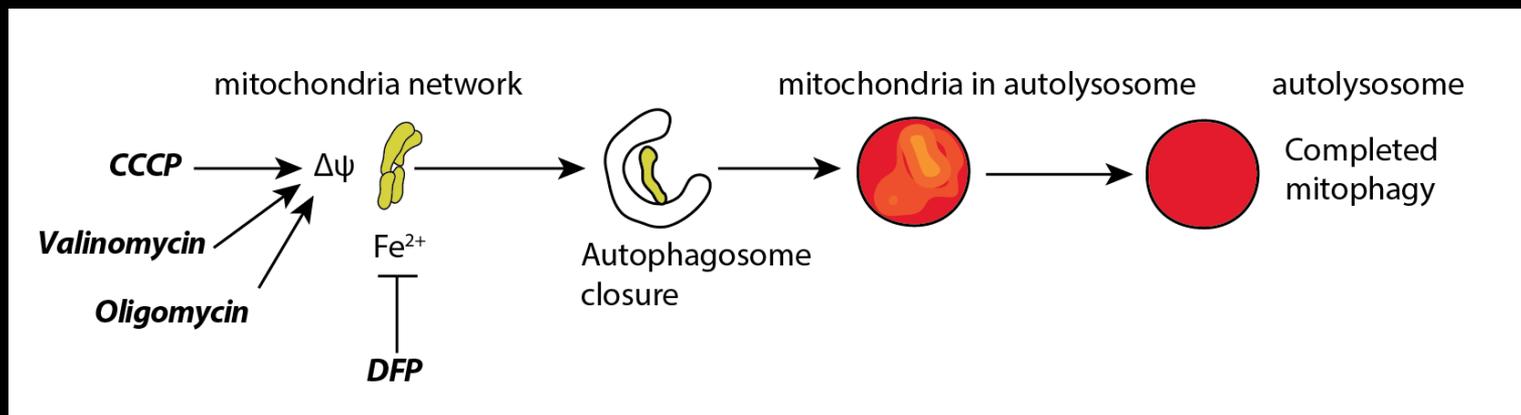

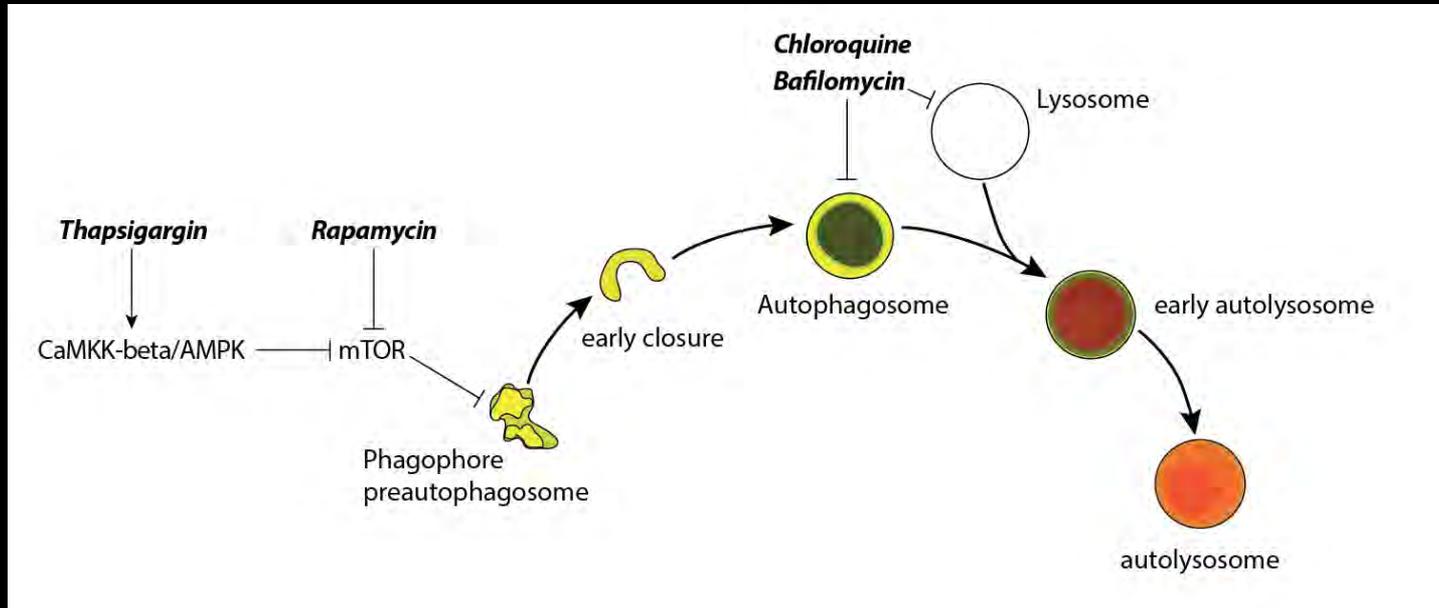

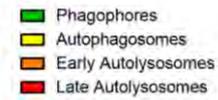

20 μ m

Autophagy phenotypes in PD cell models

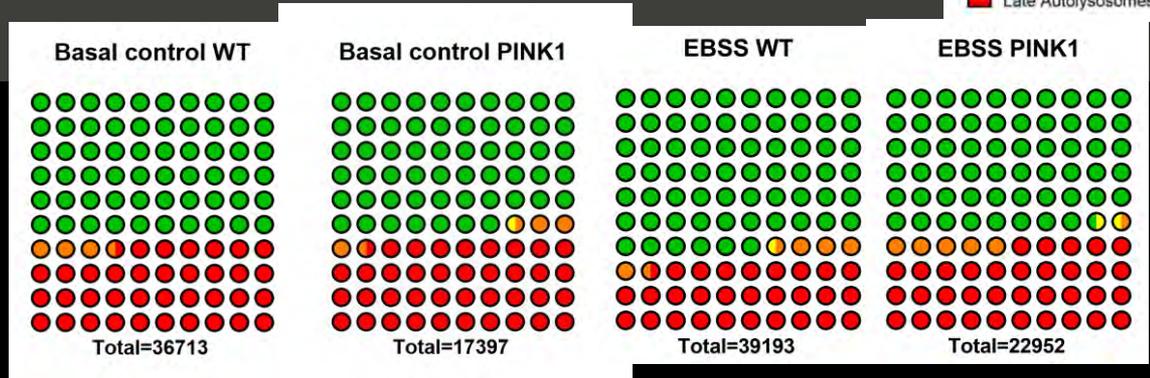

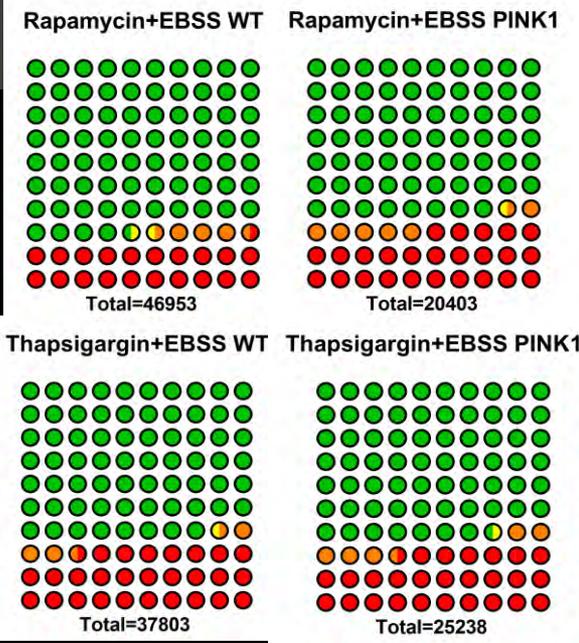

Modulation of pathways

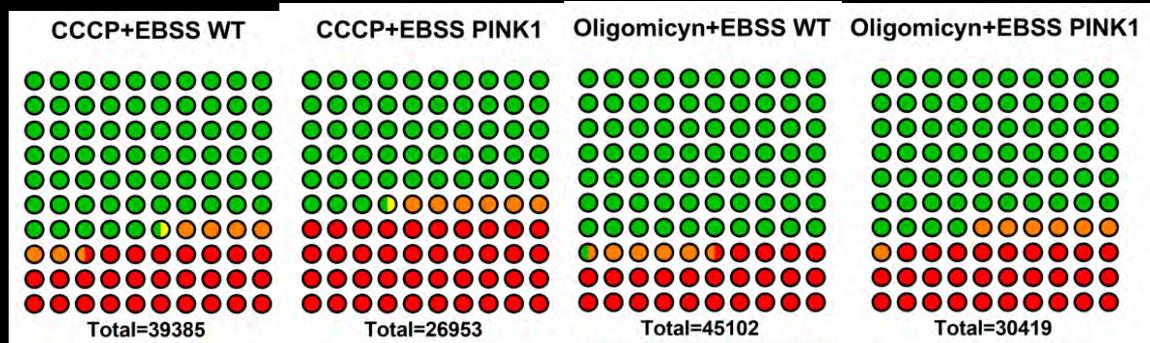

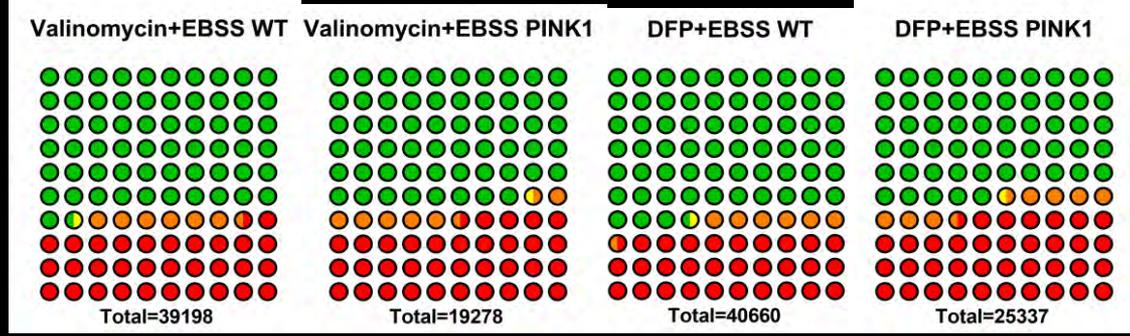

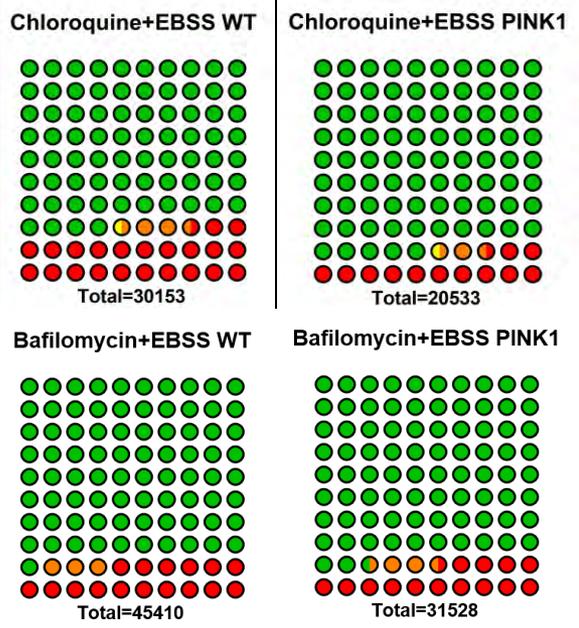

Activation of Phagophores

Mitophagy component of Autophagy

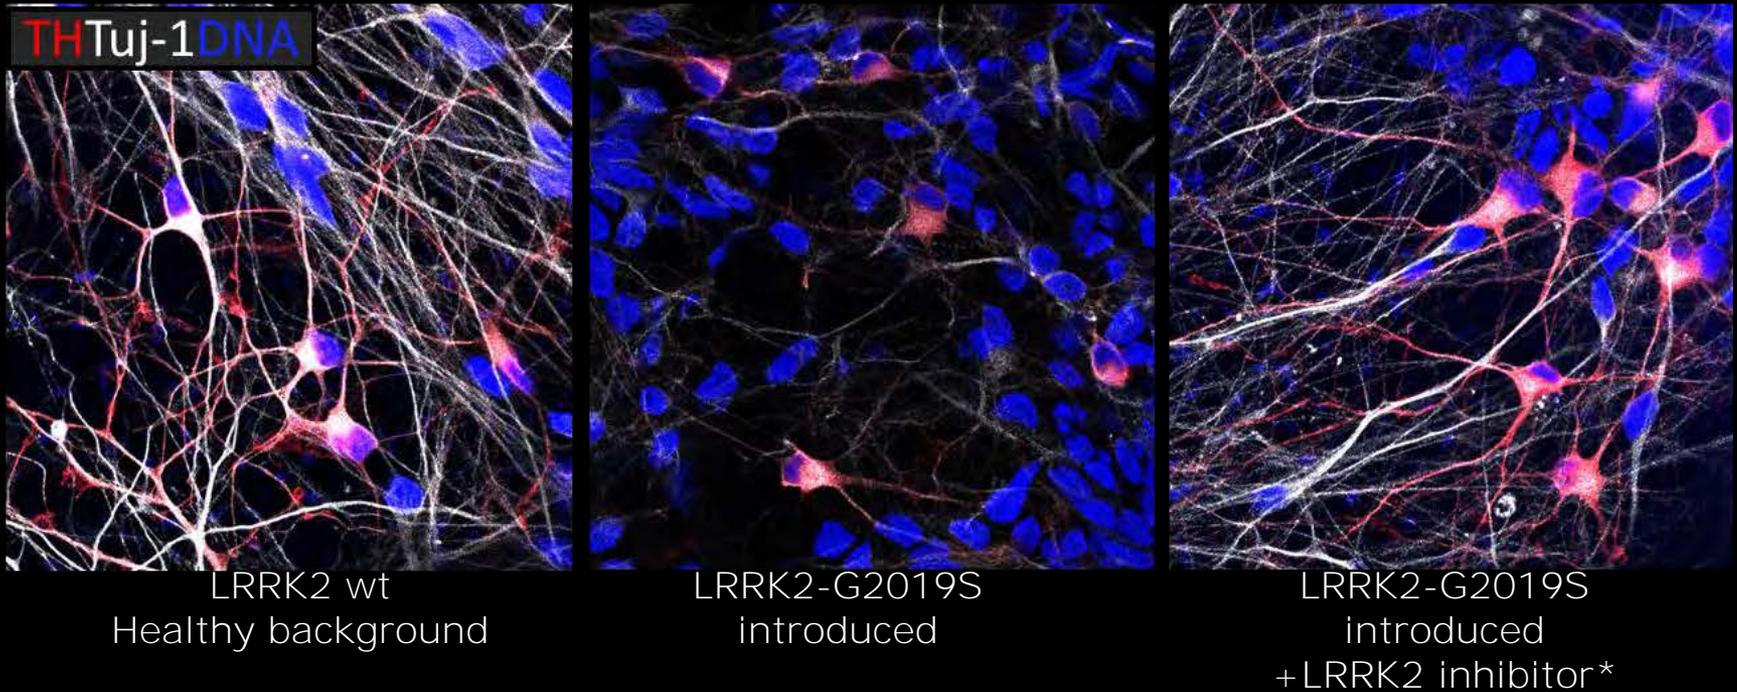

Inhibition of Lysosomal fusion

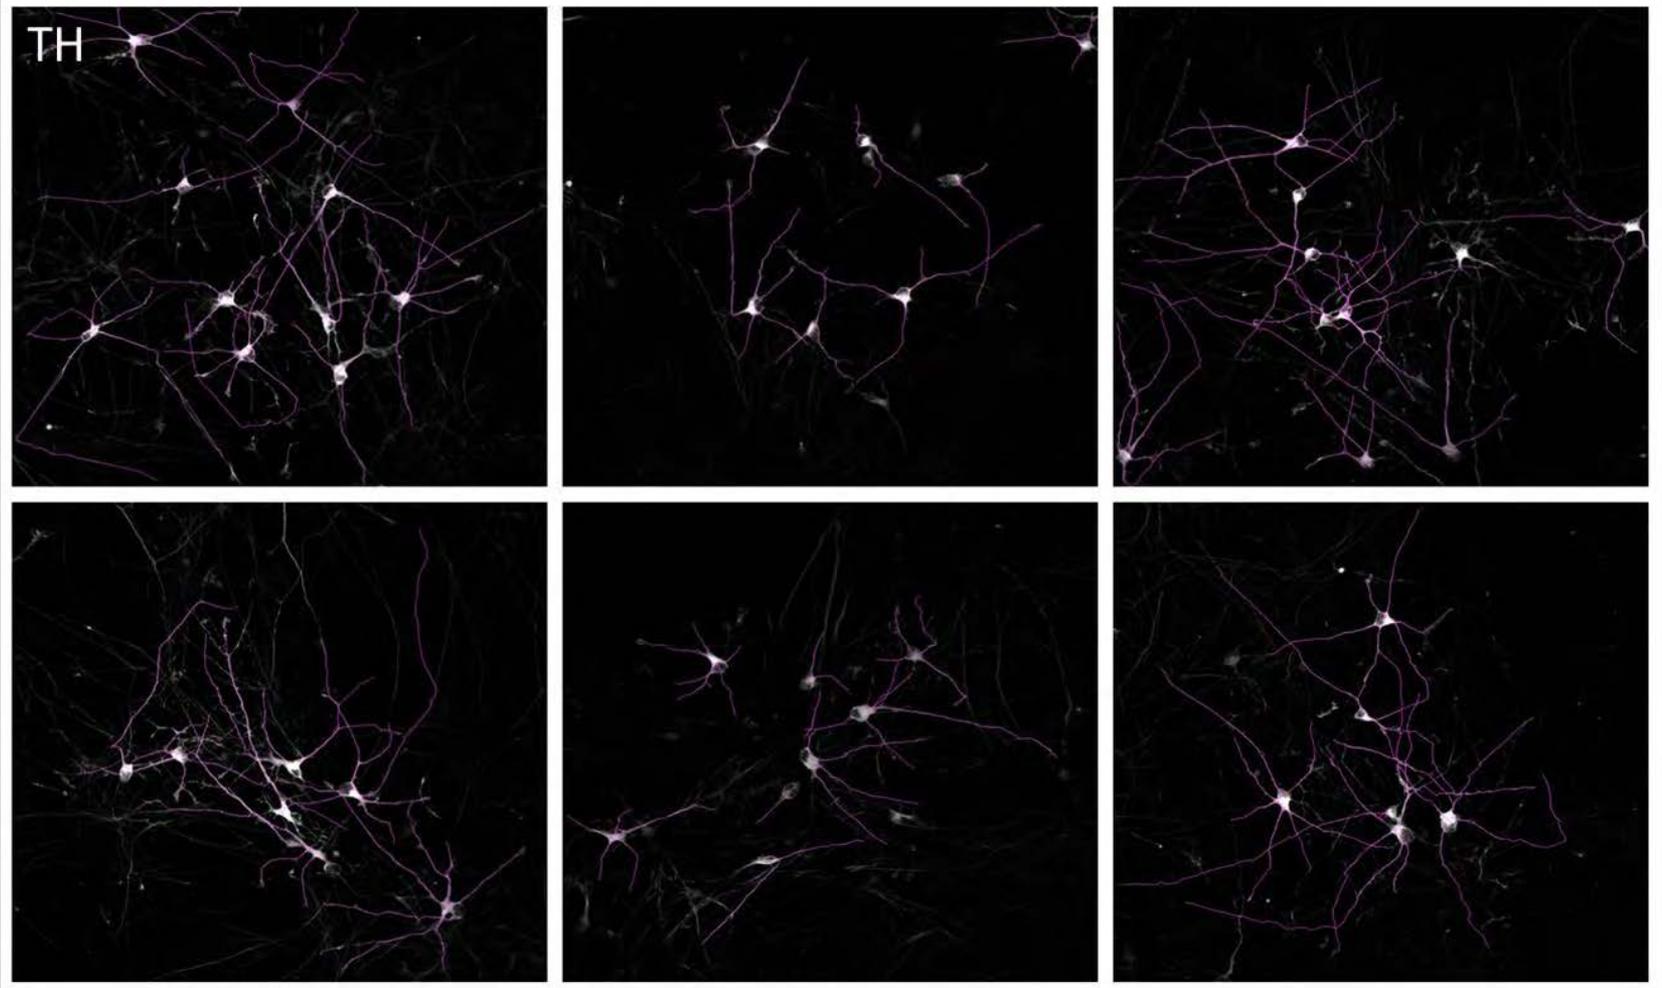

Early neuronal phenotype: Neurite complexity

- 14d differentiation starting from NESCs
- Treatment with LRRK2 inhibitor* for 12 days.
- Comparison of an engineered line to a patient line.

* Inhibitor from Ramsden et al. (2011) in ACS Chem Biol

Early neuronal phenotype: Neurite complexity

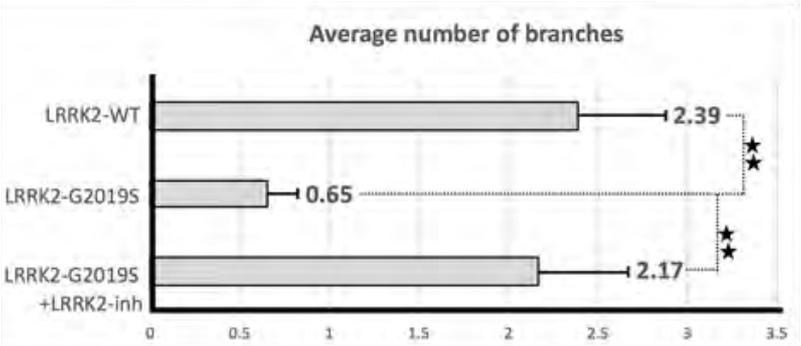

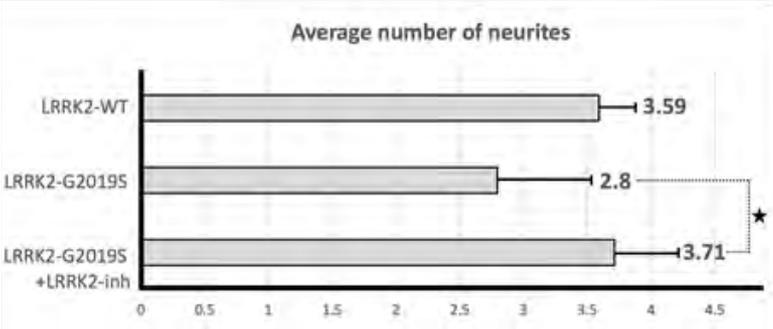

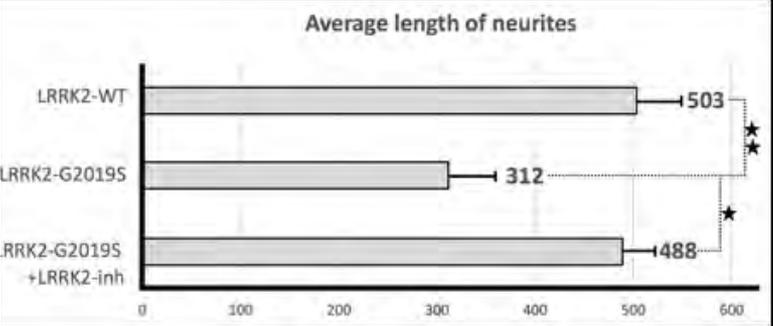

LRRK2 wt
Healthy background

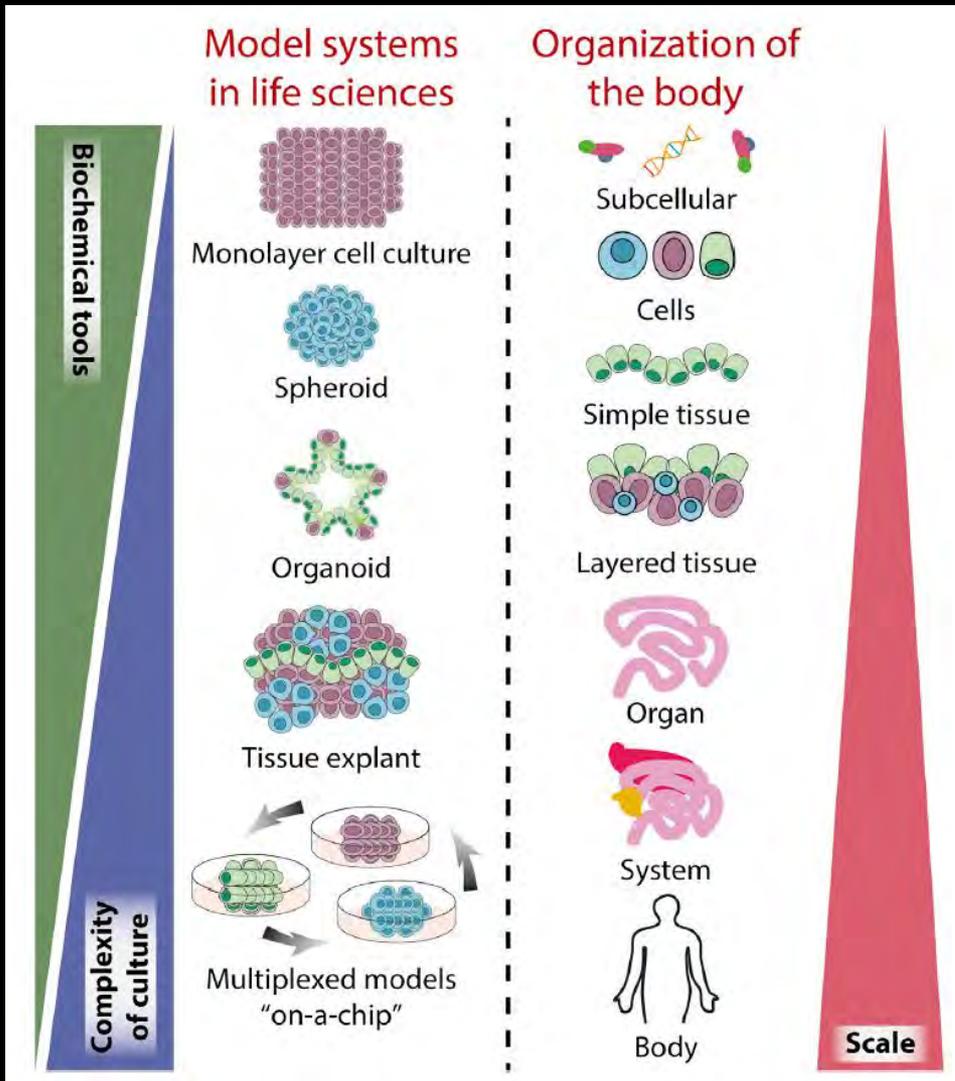

LRRK2-G2019S
introduced

LRRK2-G2019S
introduced
+LRRK2 inhibitor*

Early neuronal phenotype: Neurite complexity

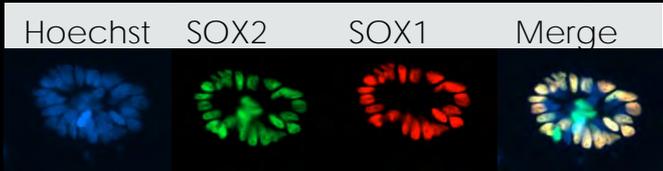

Advanced 3D models

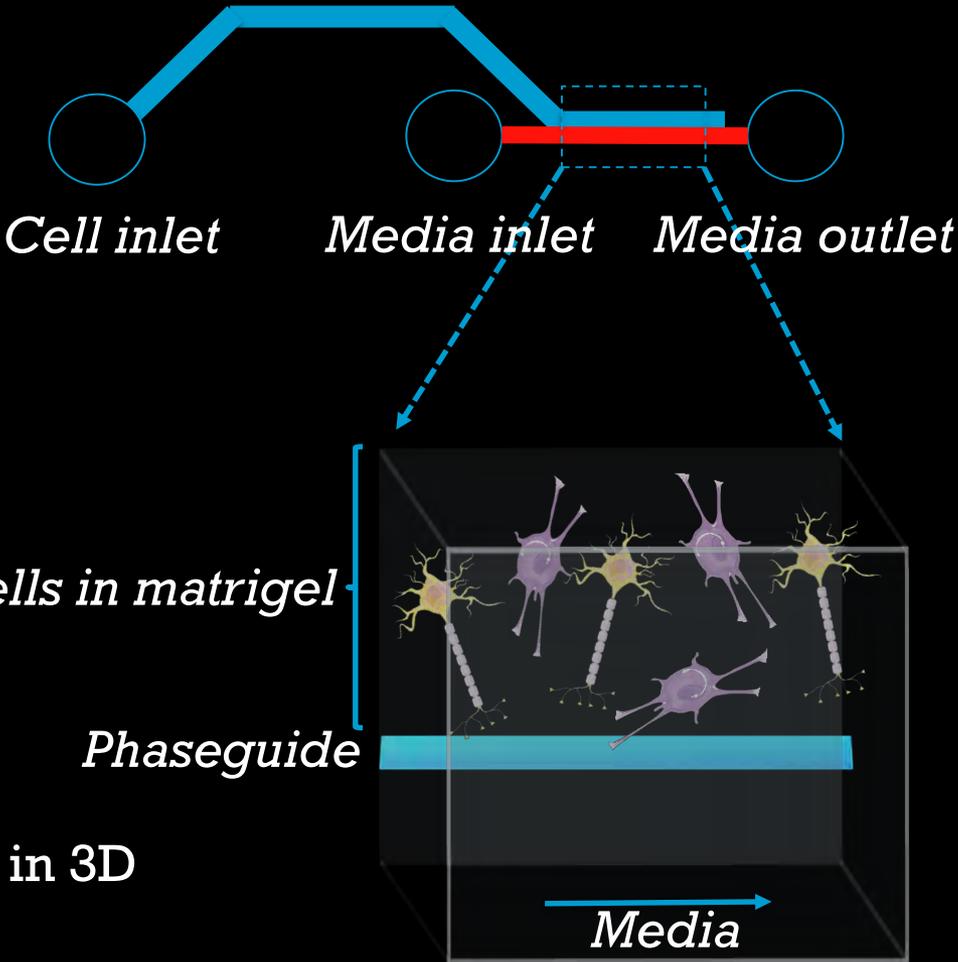

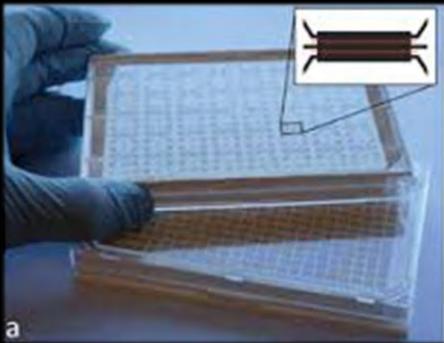

- More complex & 3D, closer to *in vivo* situation
- Stem cells exhibit an intrinsic ability to assemble into complex structures
- Mimic the natural environment as closely as possible to improve growth conditions

Human neuroepithelial stem cells (NESCs) for starting 3D cultures

hNESC (Reinhardt et al., 2013):

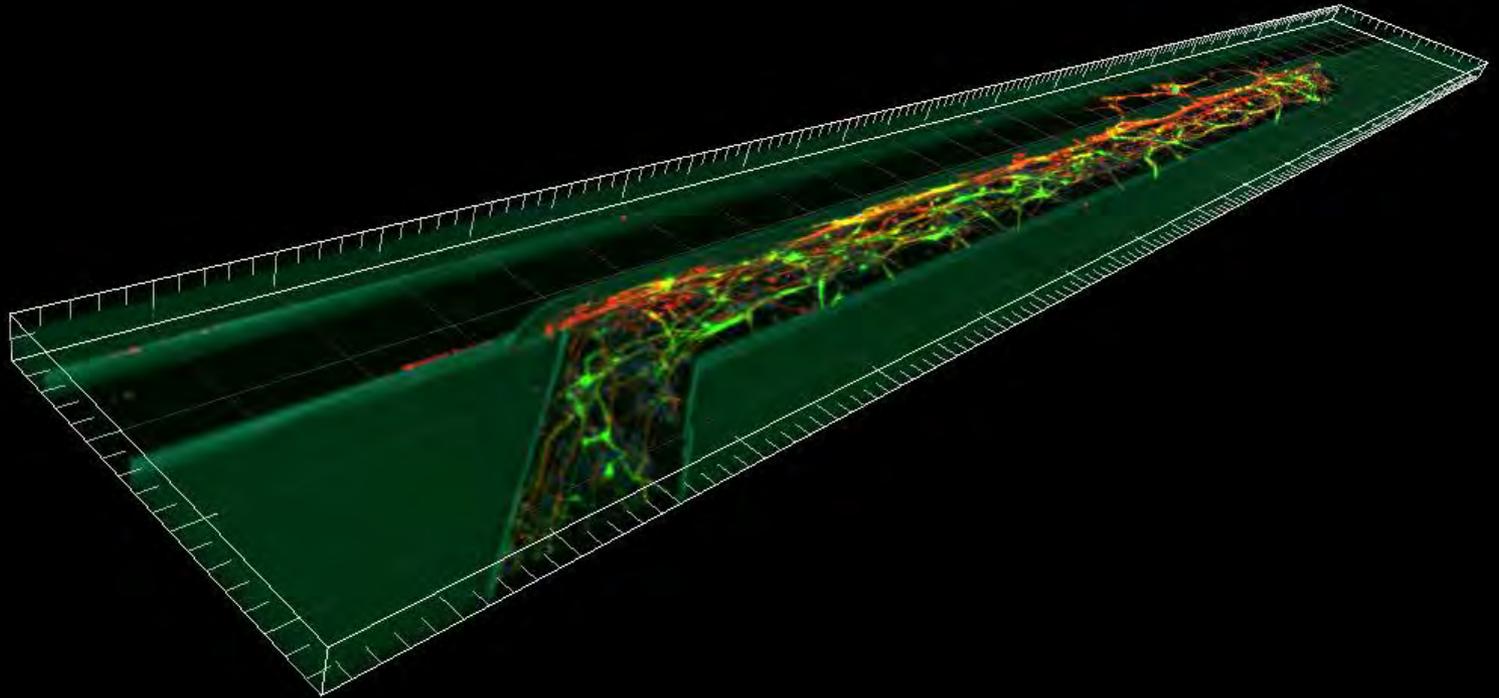

Seeding as dissociated cells

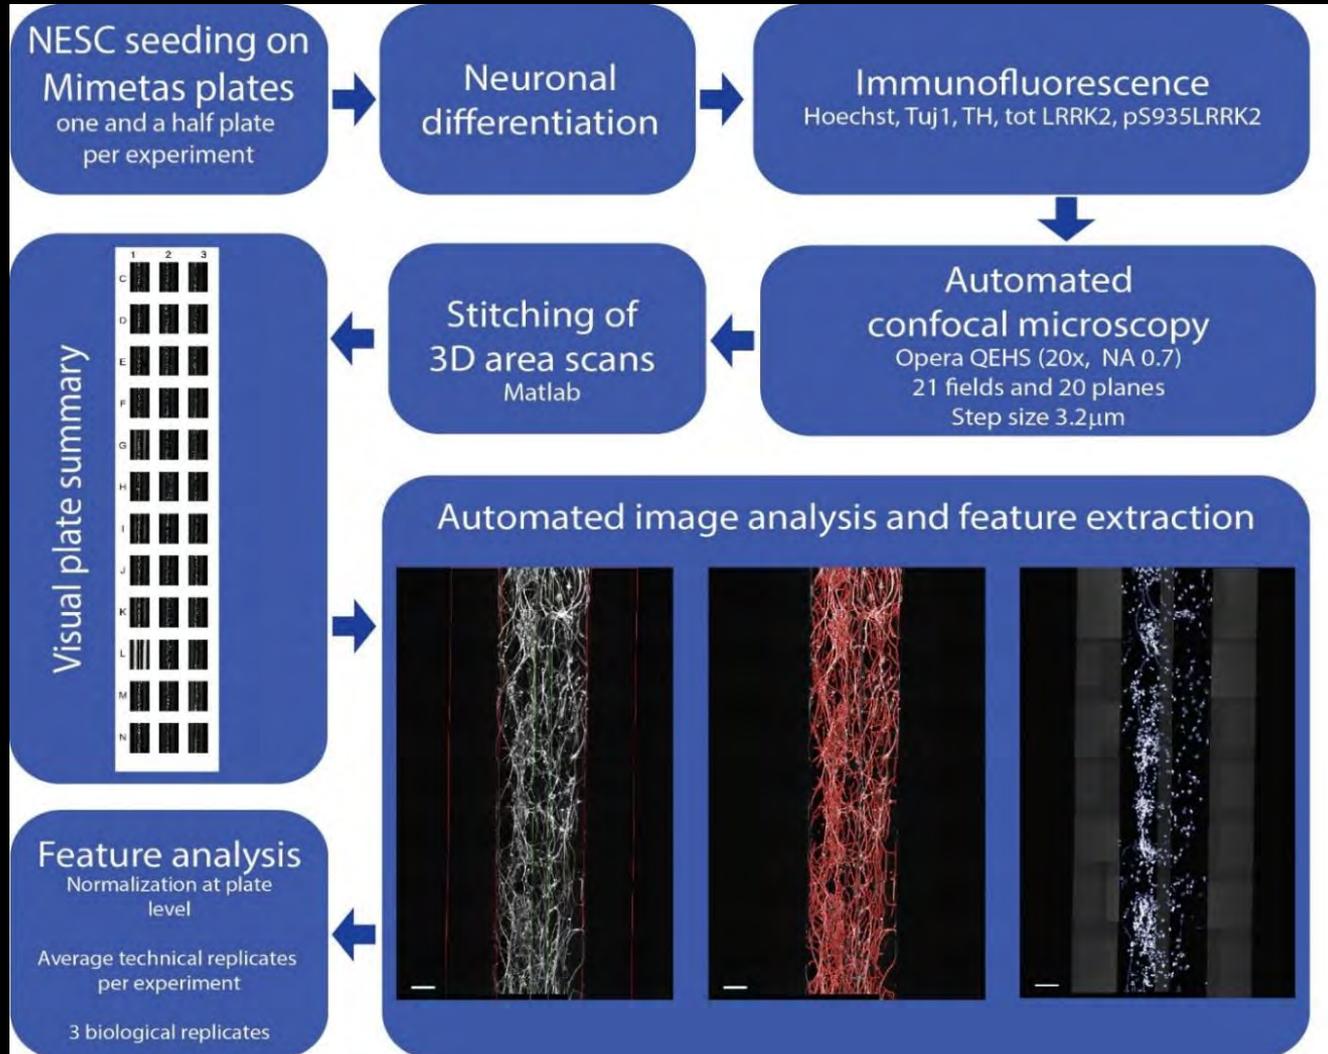

- 1) Phenotype of PD derived lines in 3D
- 2) Rescue with dugs

Differentiation into dopaminergic neurons

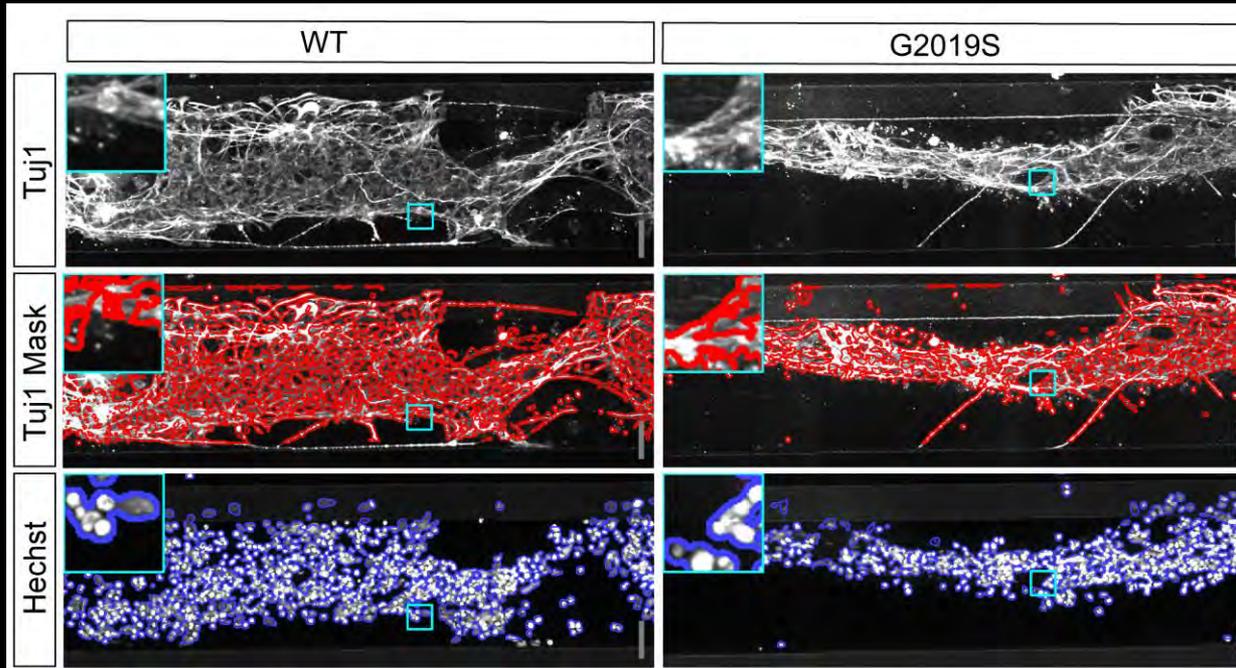

400 μm

Development of a full Pipeline from cell culture to feature analysis

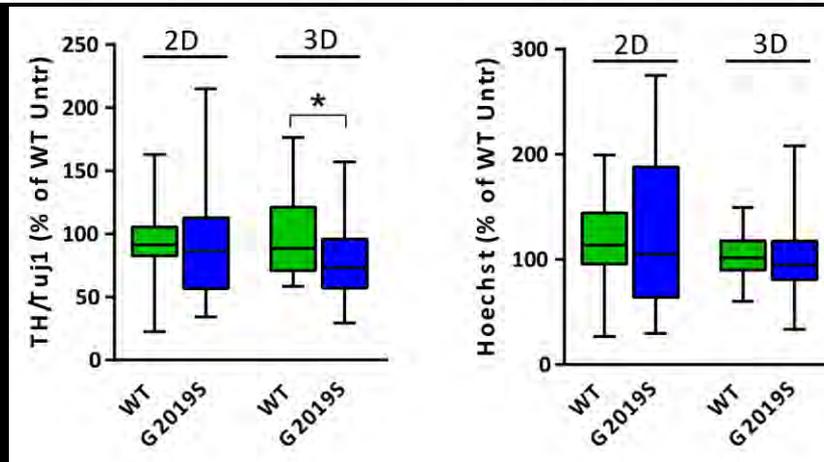

Perkin Elmer Opera HCS System

LRRK2-G2019S driven cell death in 3D

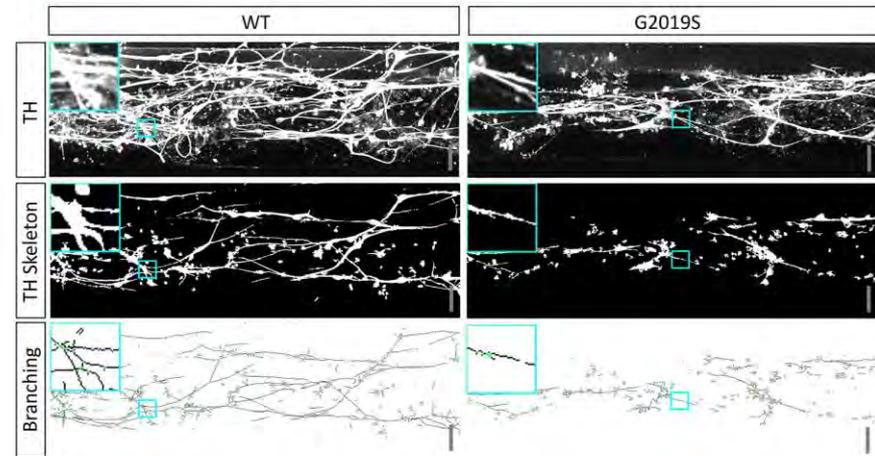

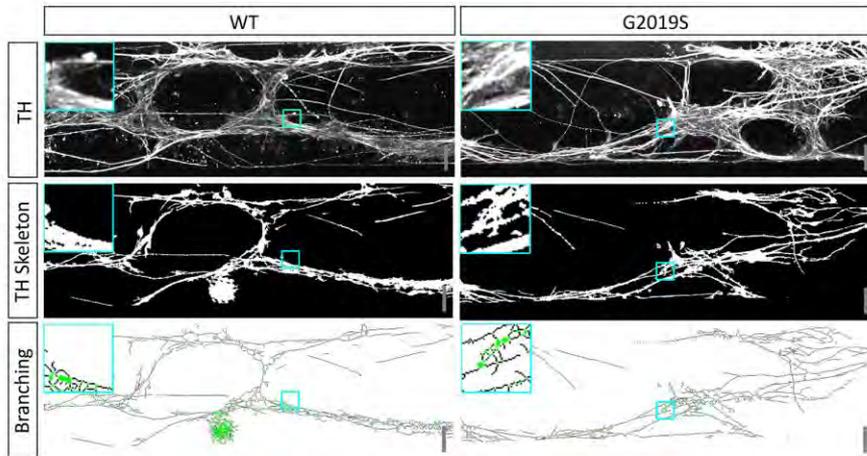

6 weeks culture

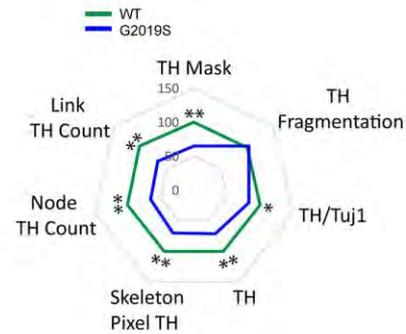

→ Clear 3D impact

Reduced neurite complexity in 3D

— WT
— G2019S

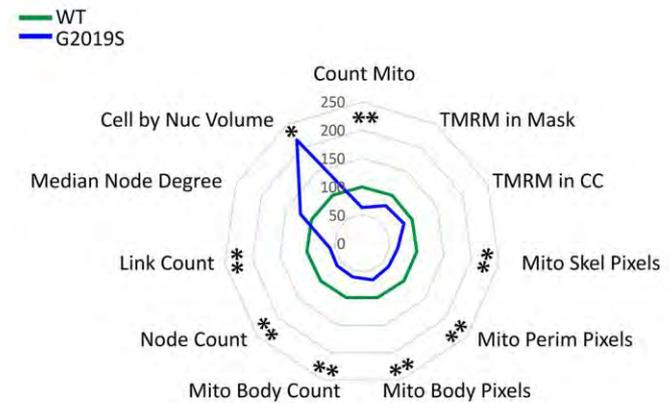

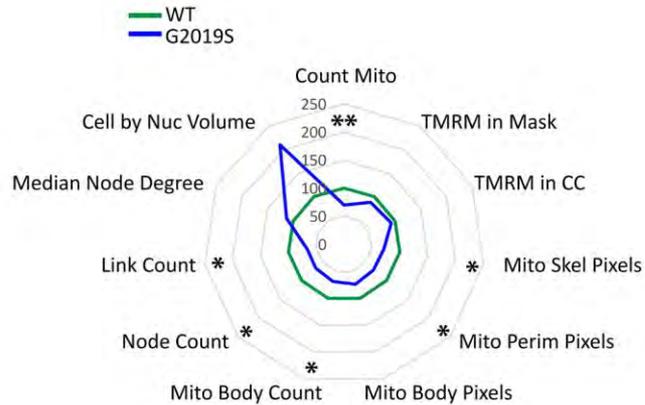

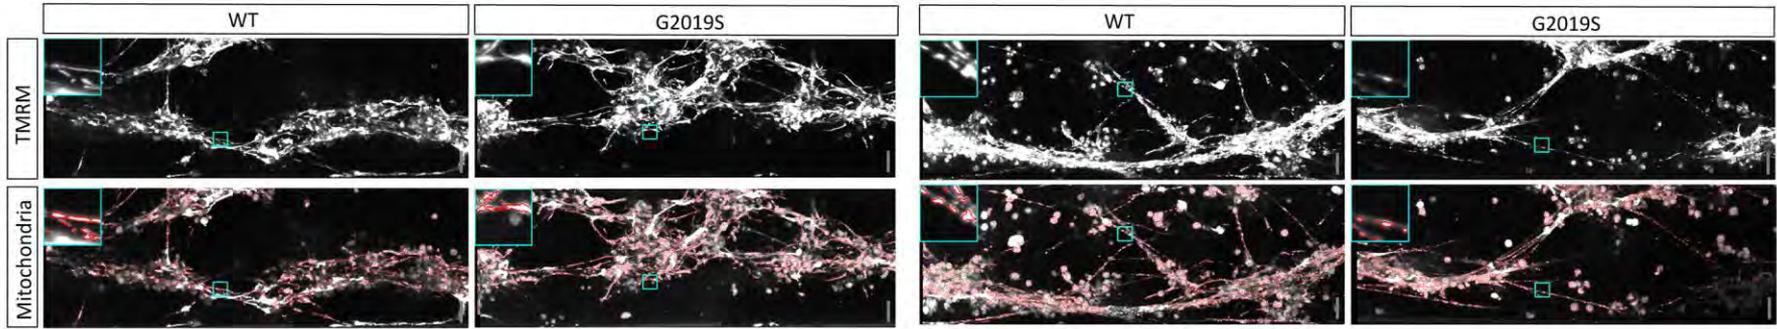

2 weeks

6 weeks

Mitochondrial phenotypes are preceding

3 weeks

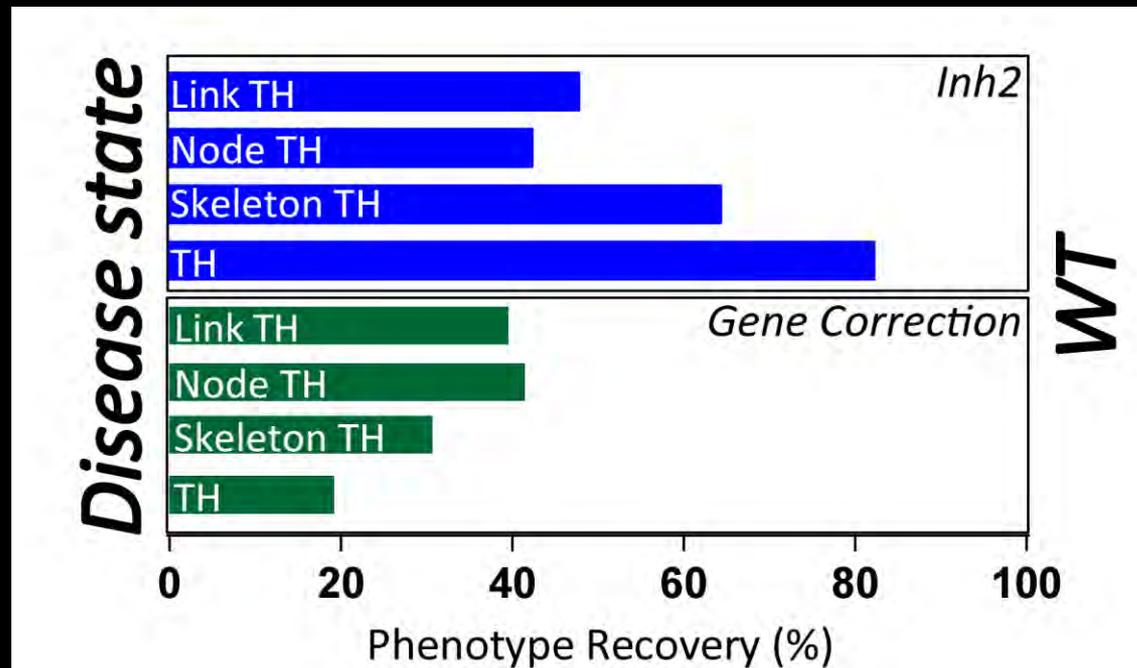

Mito tracker green
Smaller nuclei

(Partial) rescue via LRRK2 inhibitor treatment

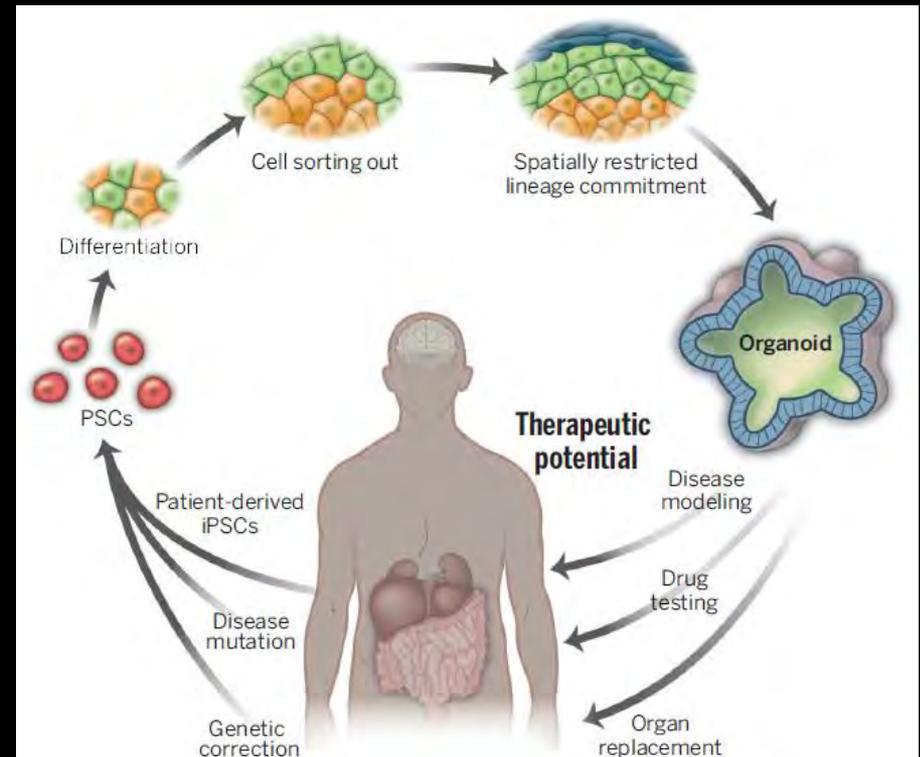

Inh2, Ramsden et al., 2011, 0.5 μ m

Gene-correction vs. drug treatment

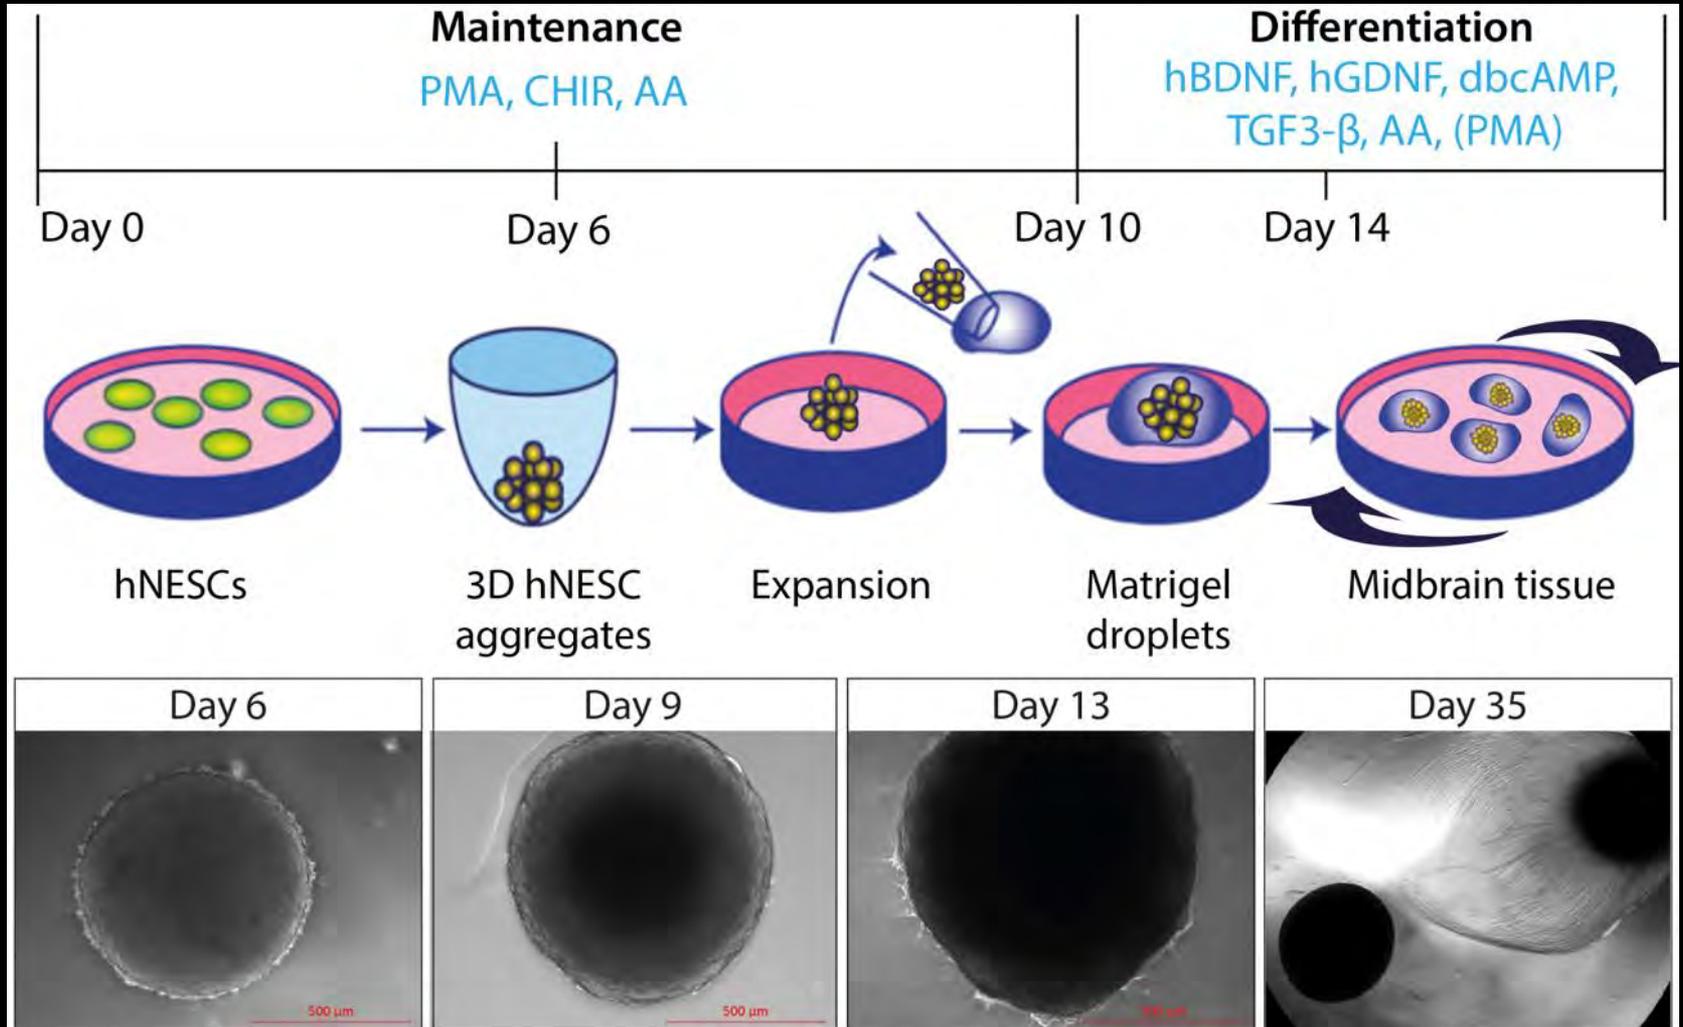

Increasing complexity with organoid systems

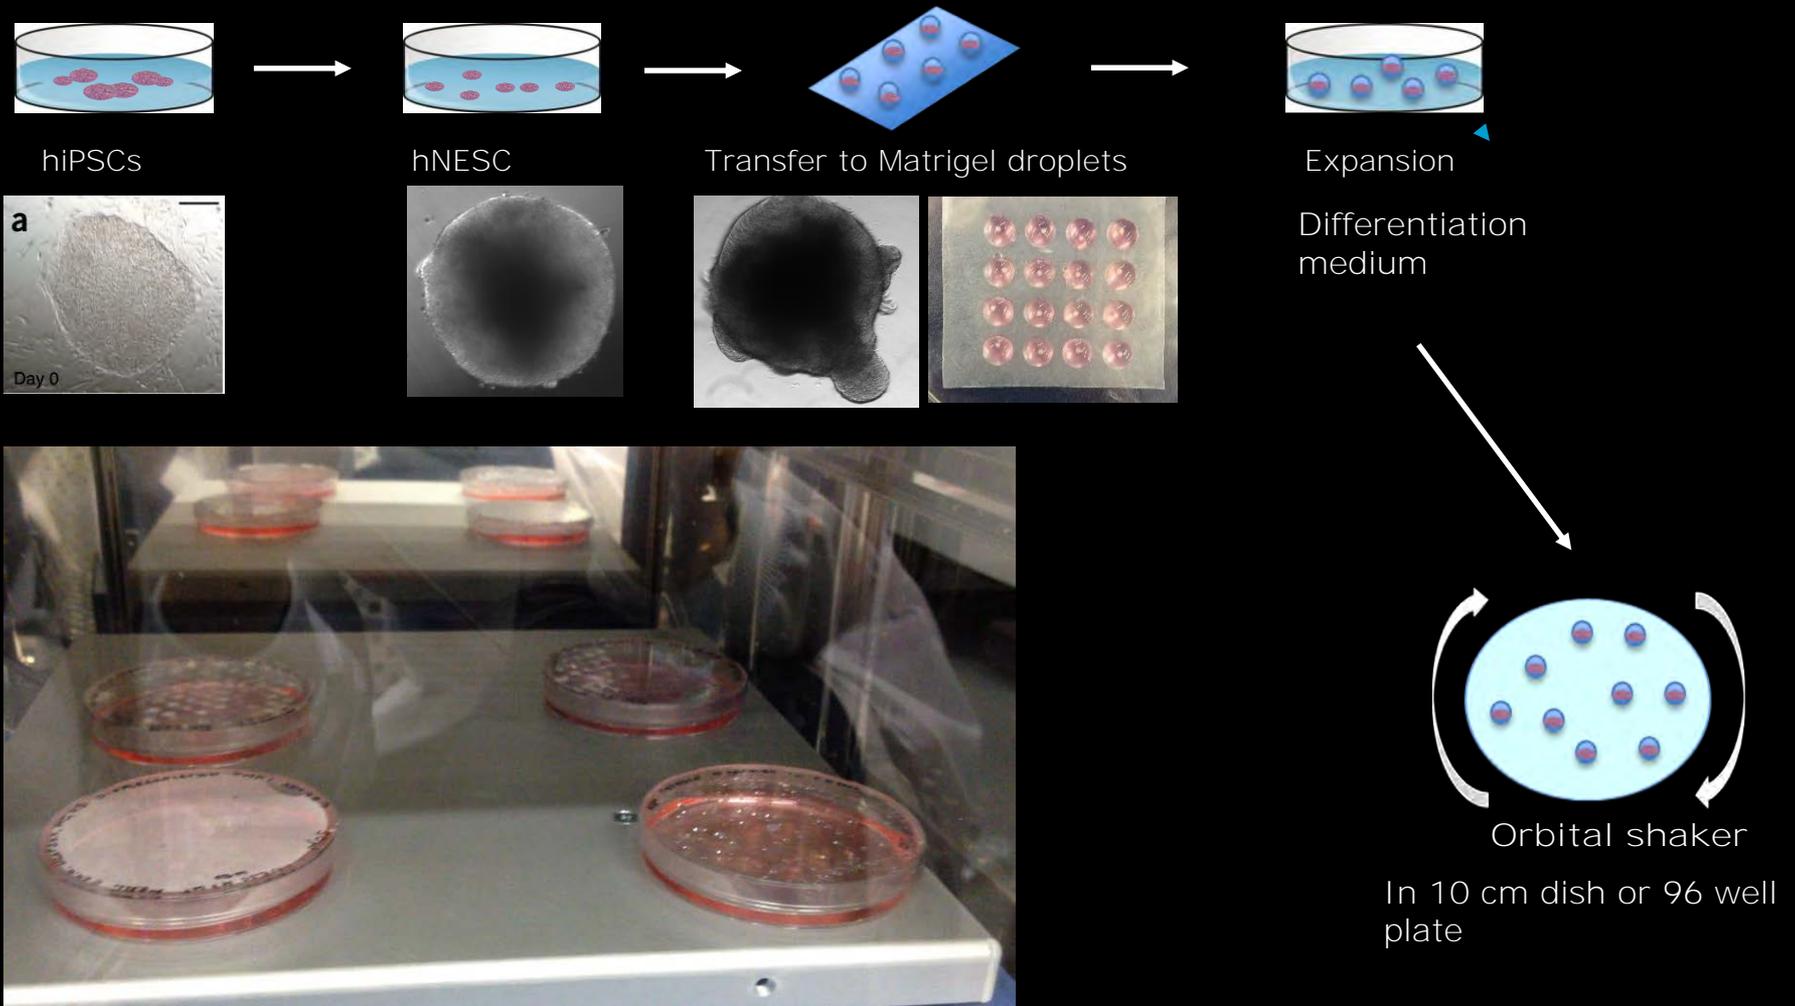

- Spatial organisation of heterogeneous **tissue-specific** cells
- Cell-cell interactions, cell-ECM interactions
- **Physiological functions** generated by tissue-specific cells
- **Stable system** amenable to extended cultivation and manipulation
- Patient-specific
- Reproducible

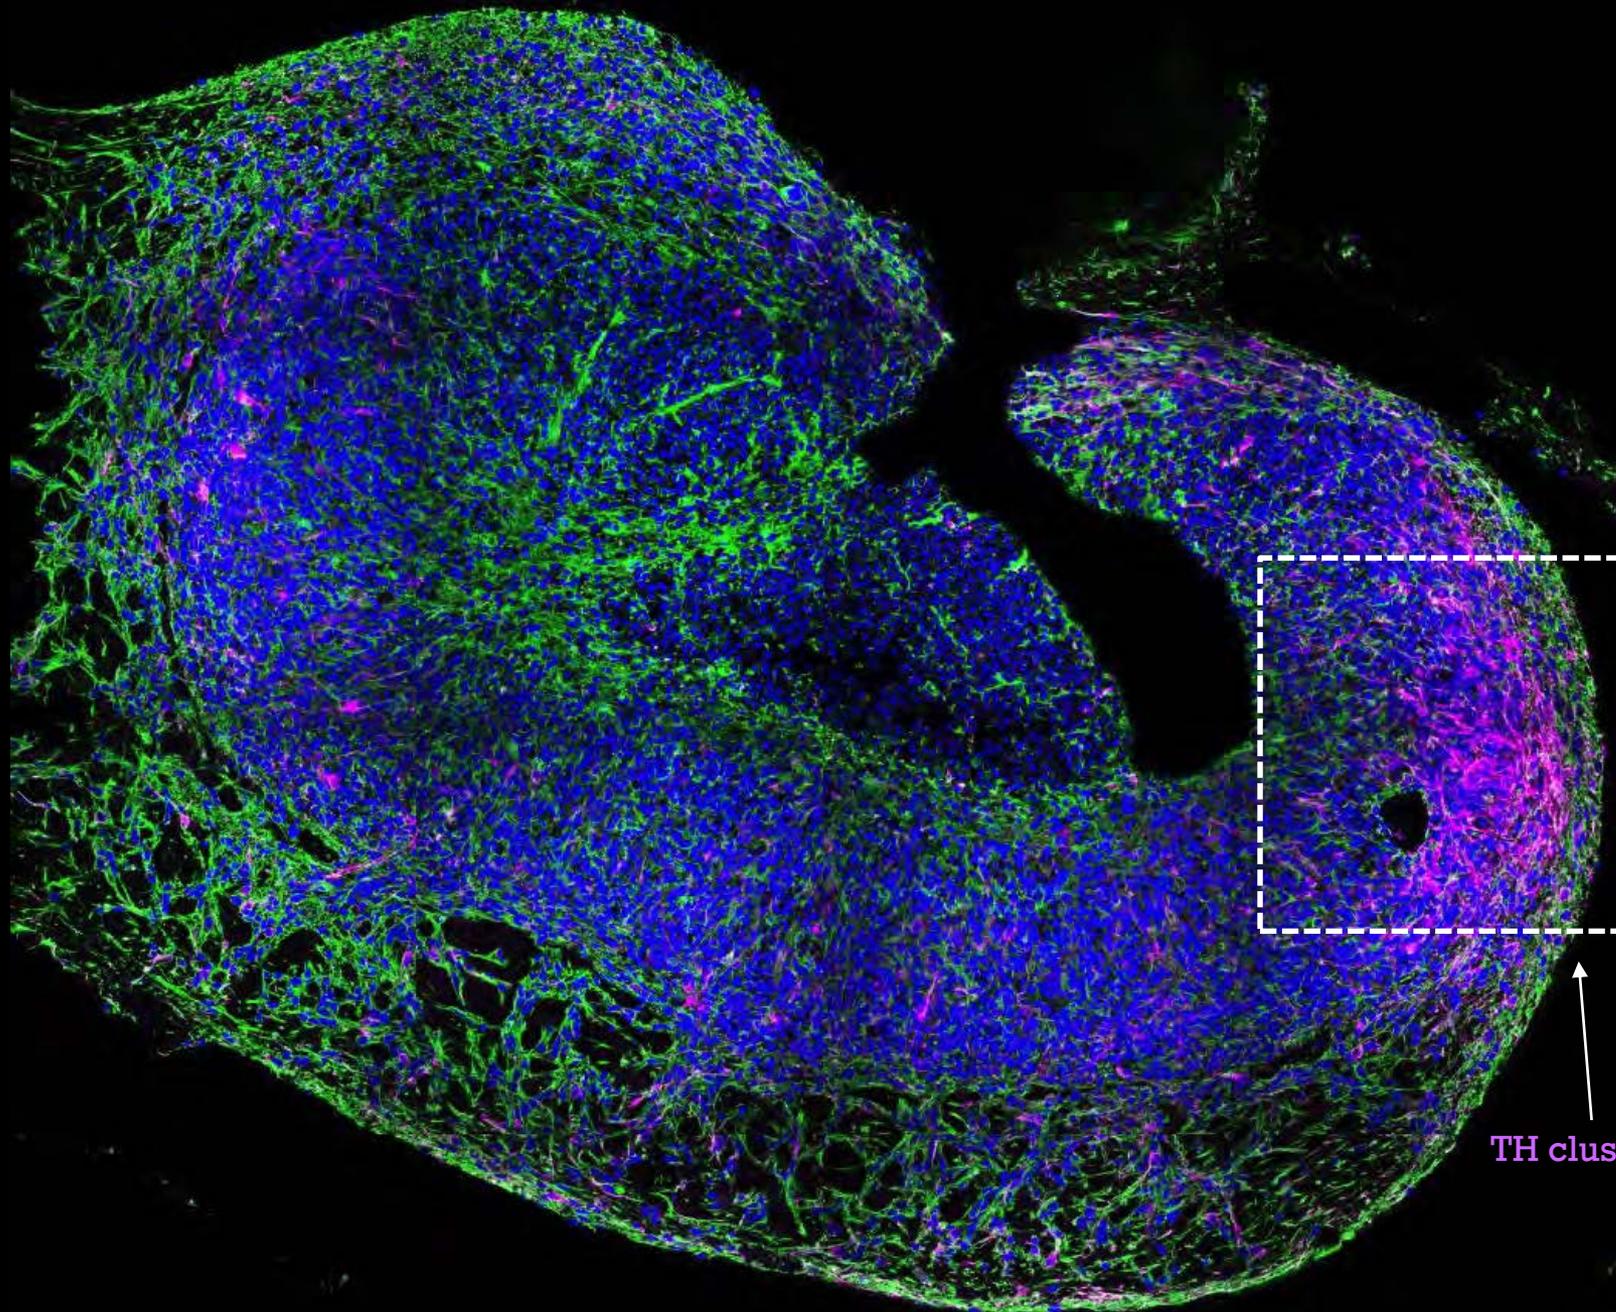

Generation of Midbrain Organoids: Dynamic Condition

Generation of midbrain organoids

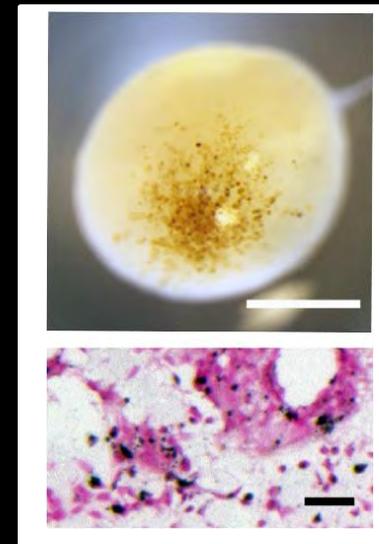

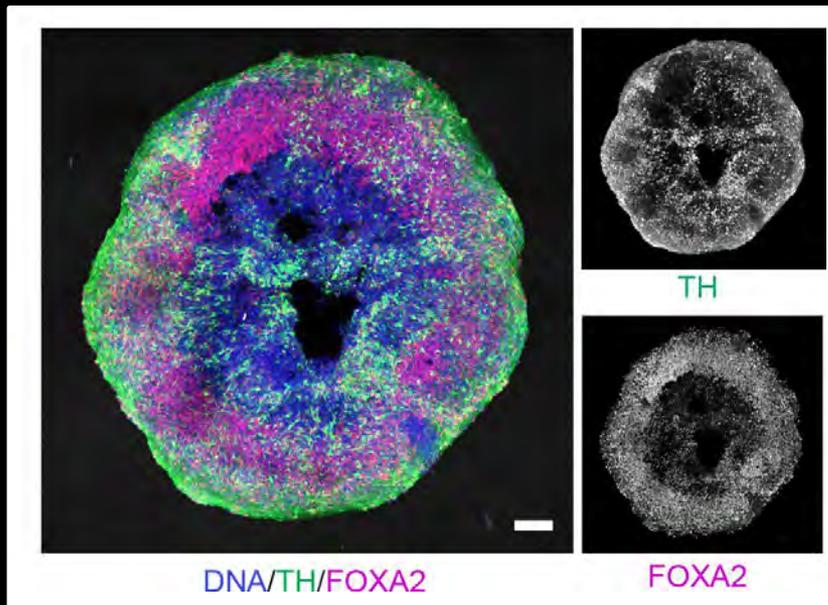

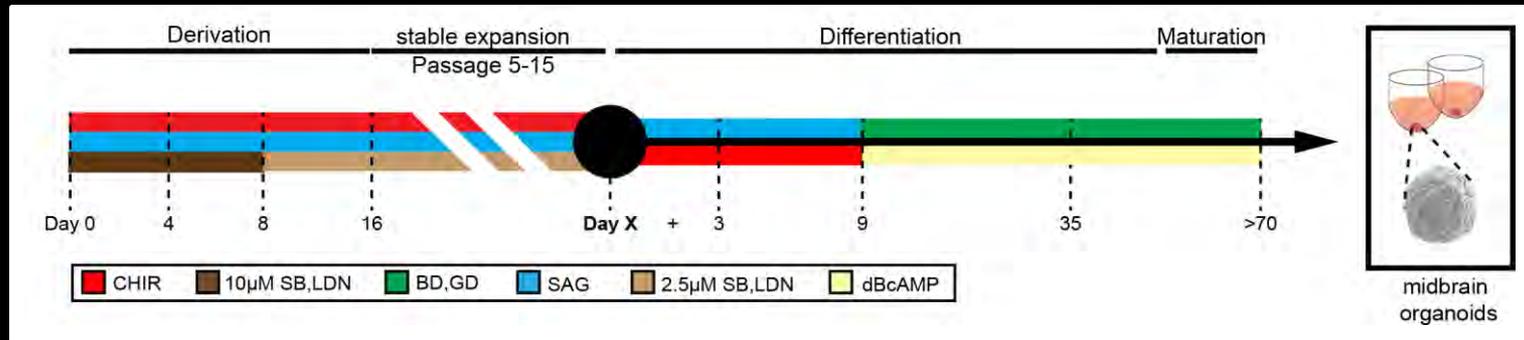

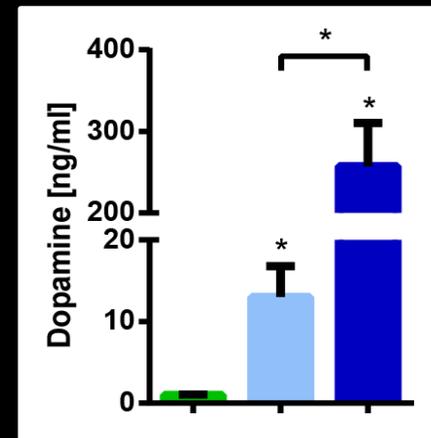

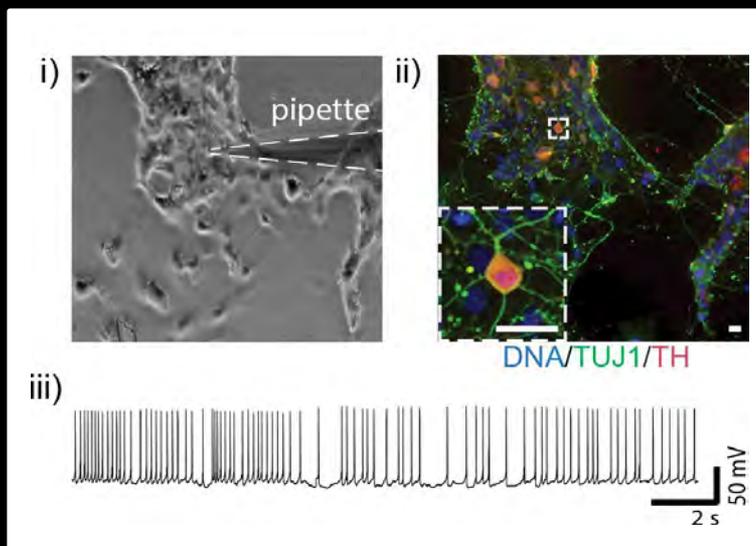

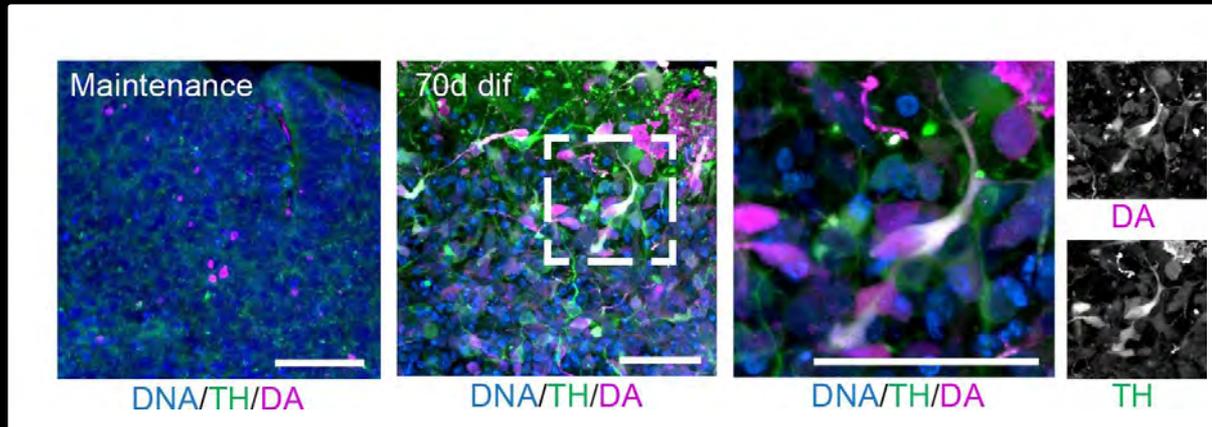

TuJ1
TH
Hoechst

TH cluster

Derivation of more ventralized organoids

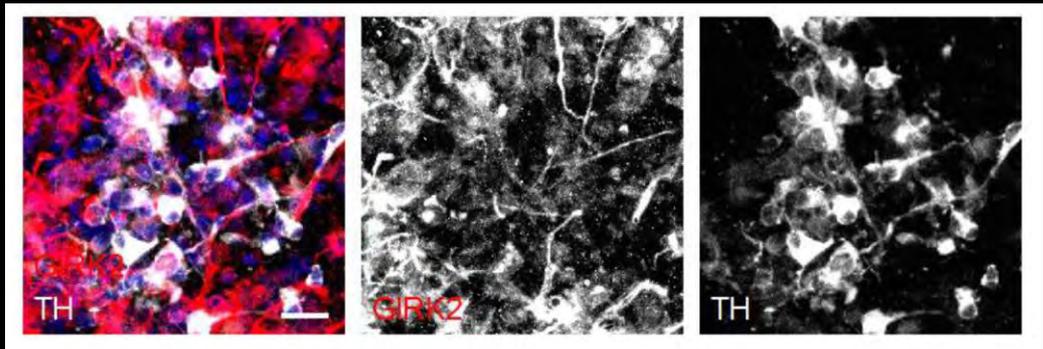

Dopaminergic activity in ventralized organoids

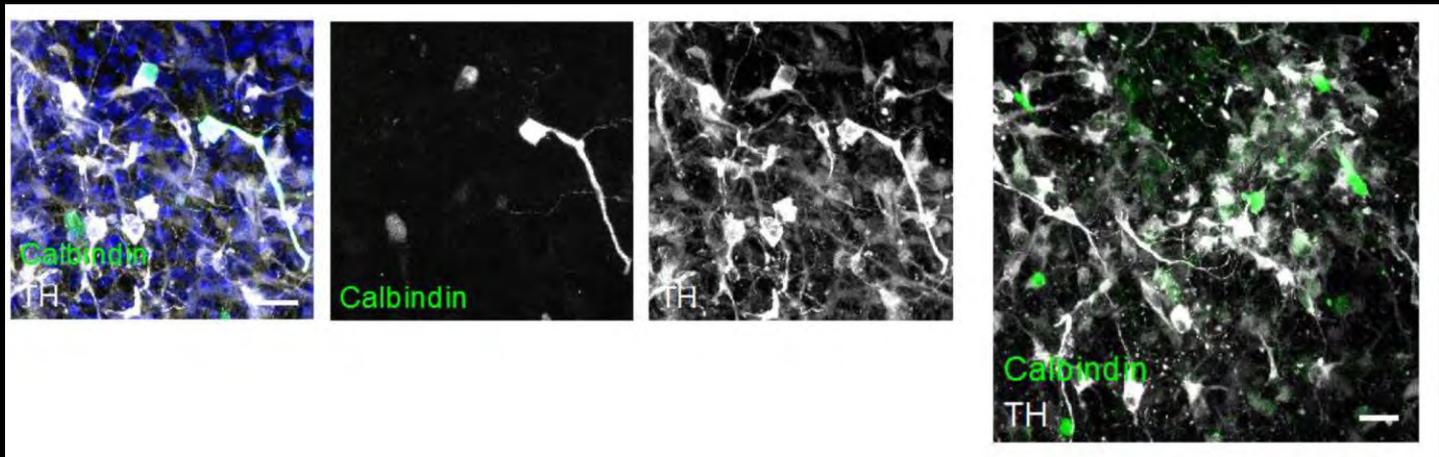

vNESC
35d Dif.
70d Dif

A9 / A10 dopaminergic neurons

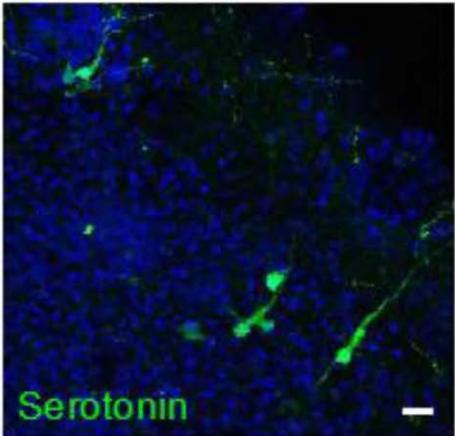

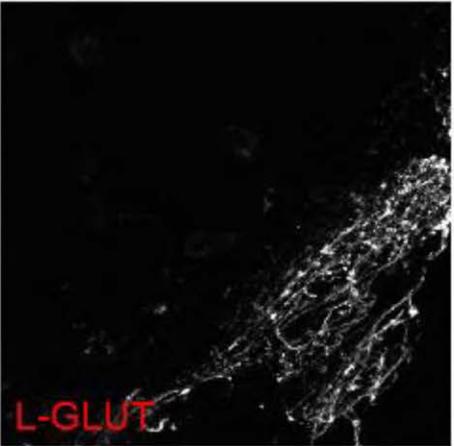

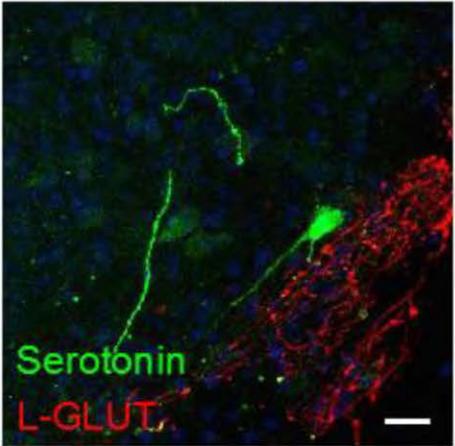

A9
TH/Girk2

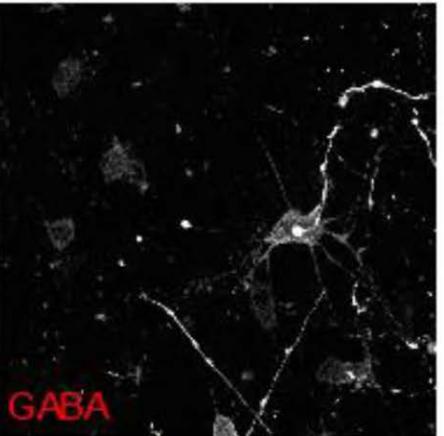

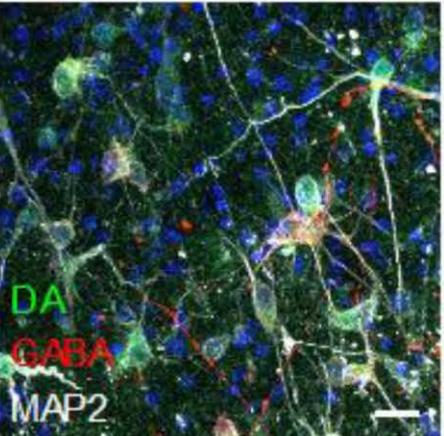

A10
Calbindin/TH

Other neurons

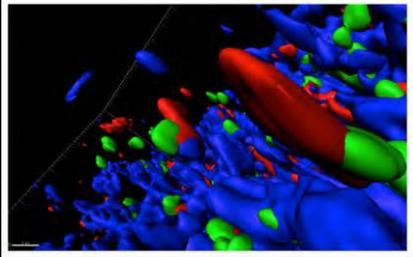

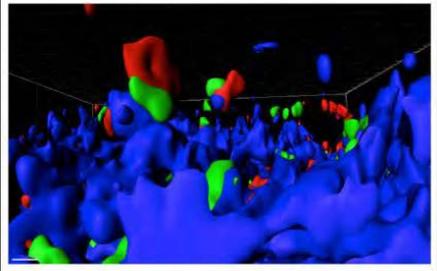

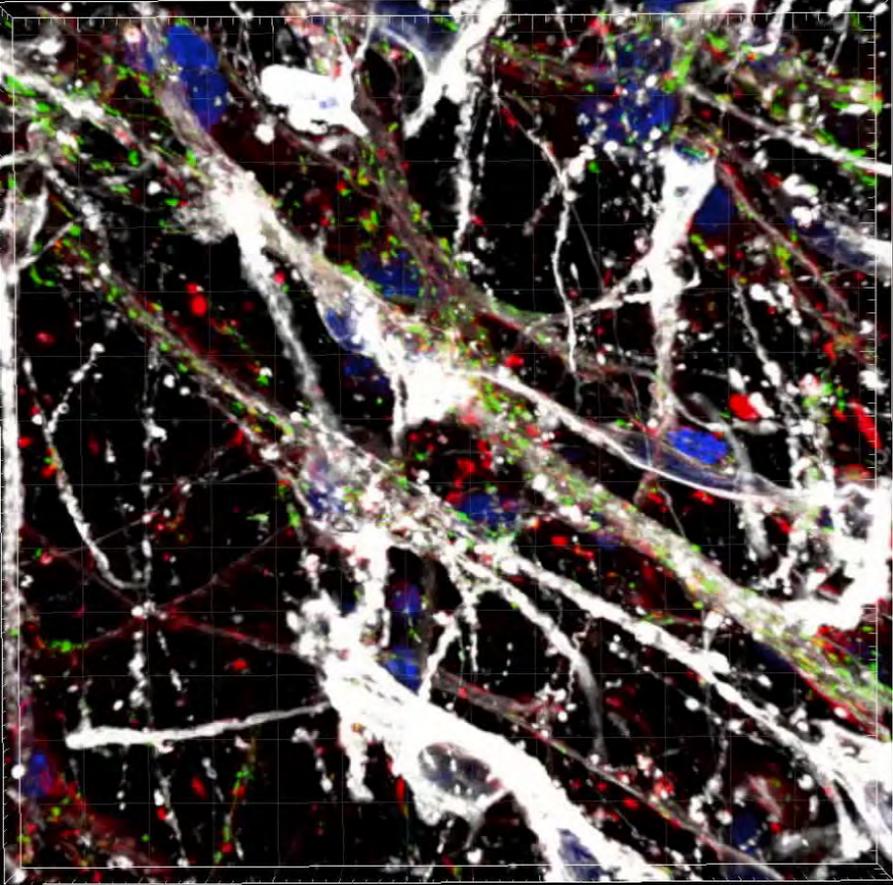

C

Synapse formation

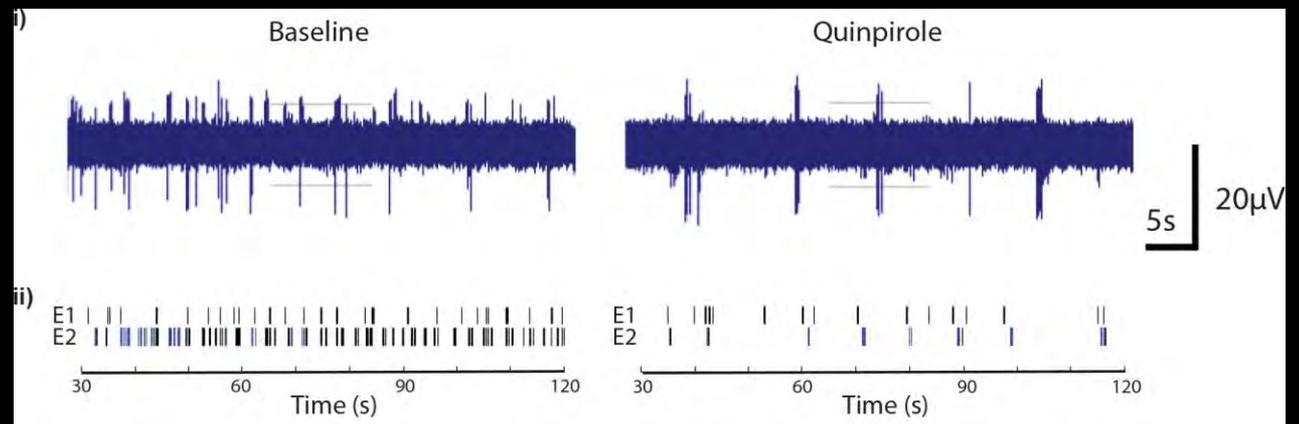

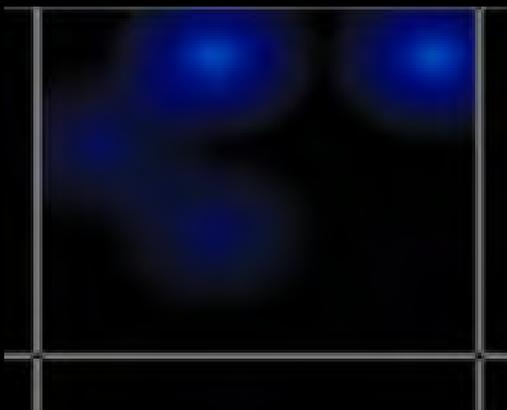

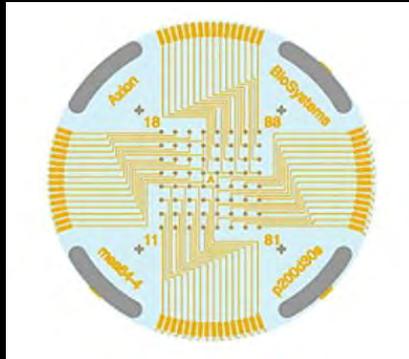

Synaptophysin PSD-95 Hoechst

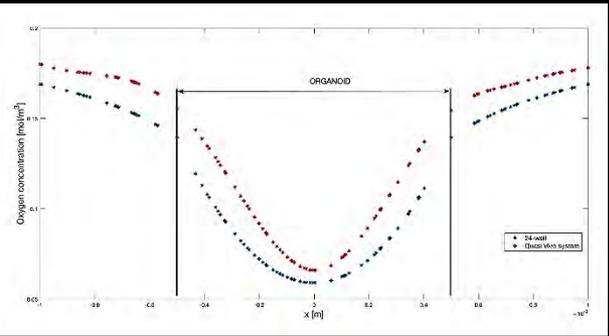

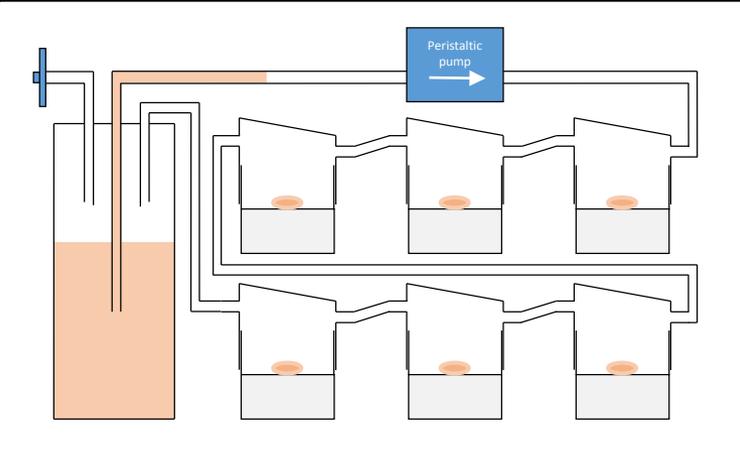

Microelectrode Array (MEA)

Grid of microelectrodes to capture electrophysiological data from multiple cells simultaneously

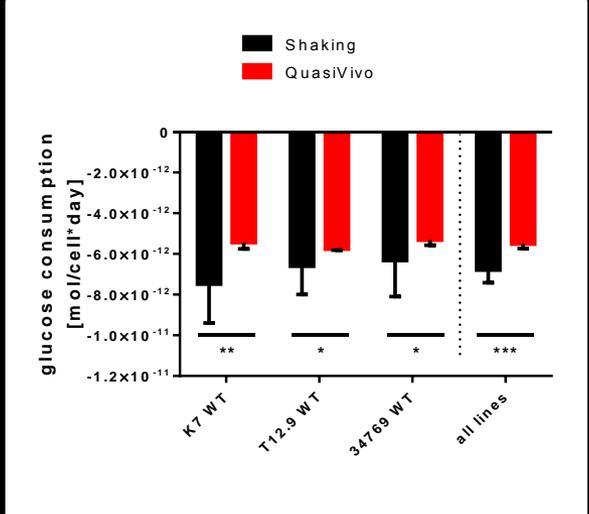

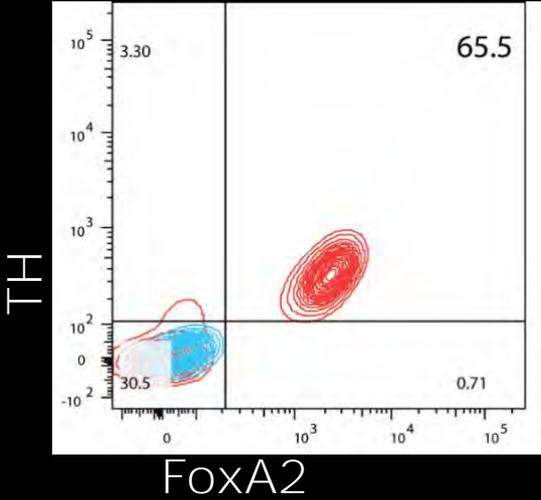

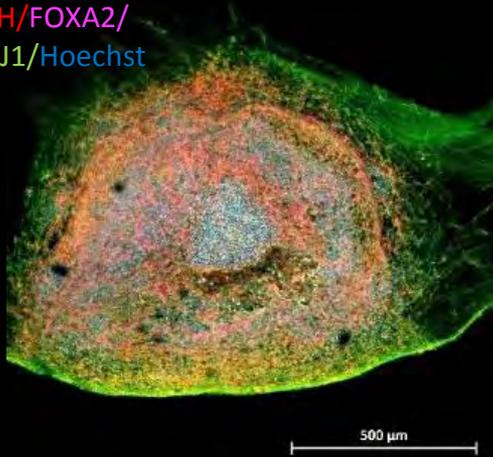

Cellular network communication

Millifluidics technology for midbrain organoid generation

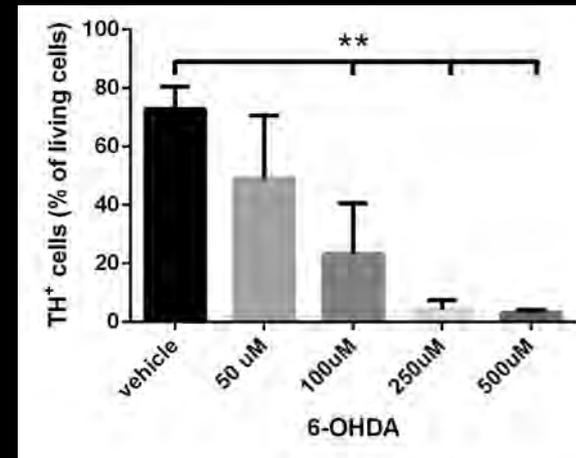

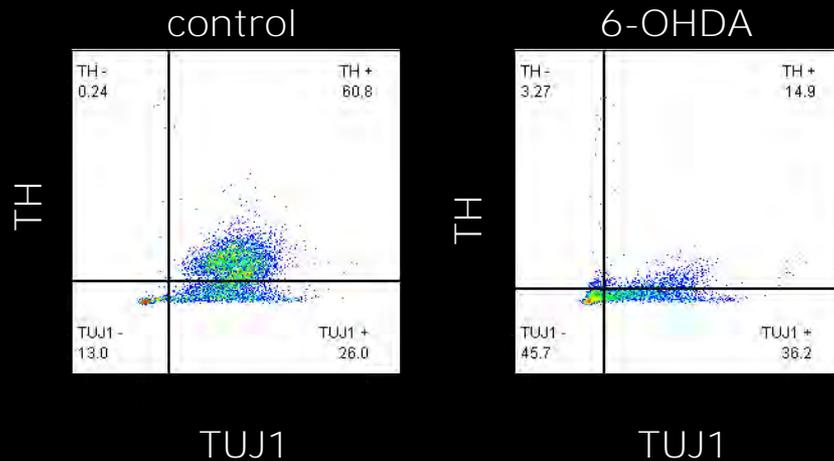

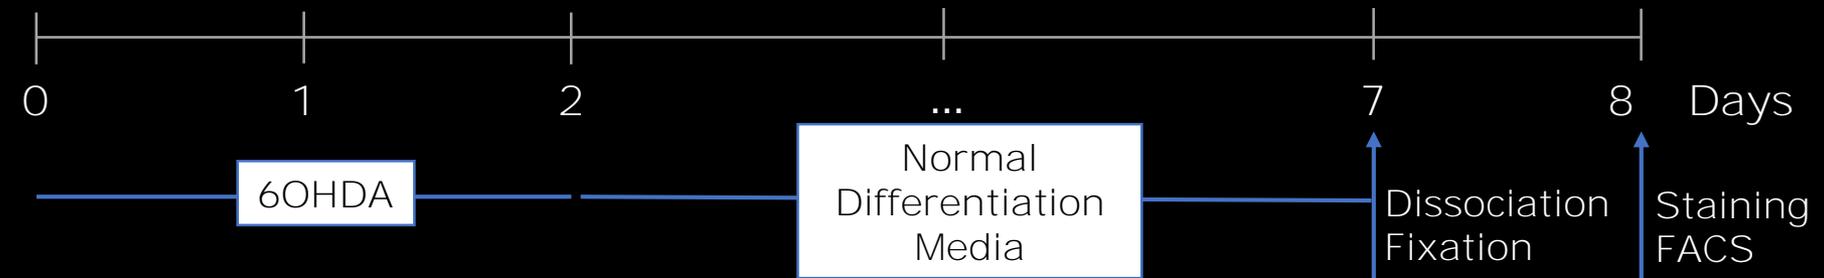

TH/FOXA2/
TUJ1/Hoechst

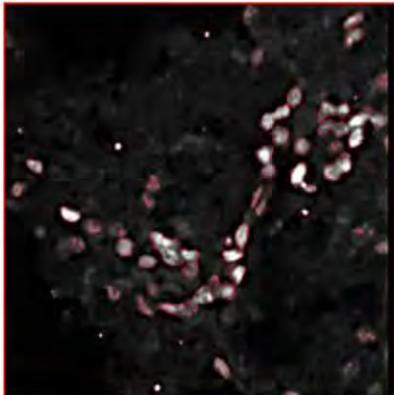

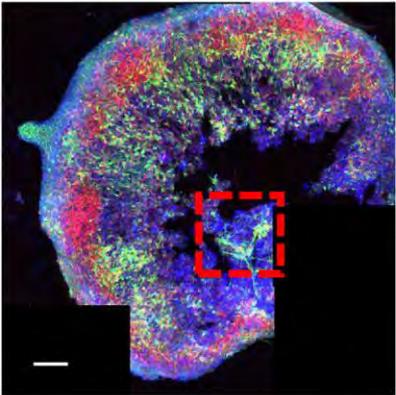

Toxicology in midbrain organoids

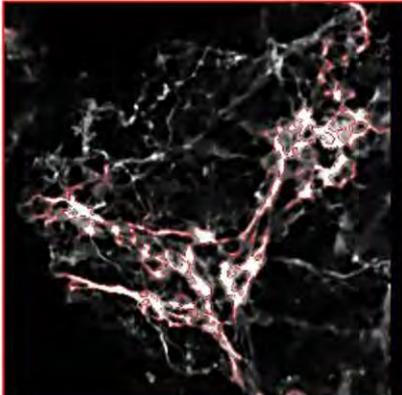

→ selective loss of dopaminergic neurons

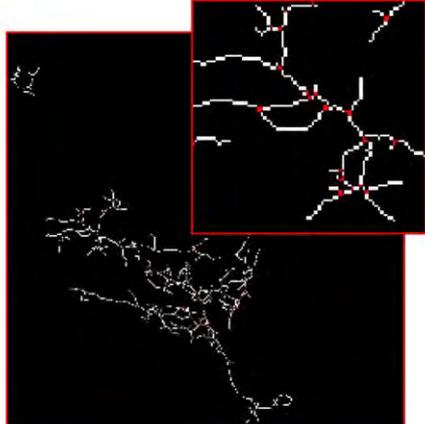

Pipeline for phenotyping in organoids

FOXA2 mask

TH mask

TH skeleton

Automated mask detection

Nuclei segmentation

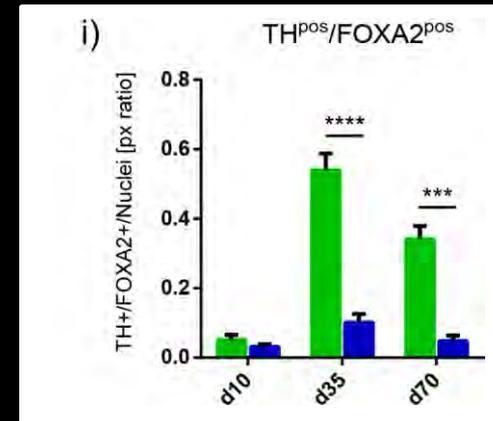

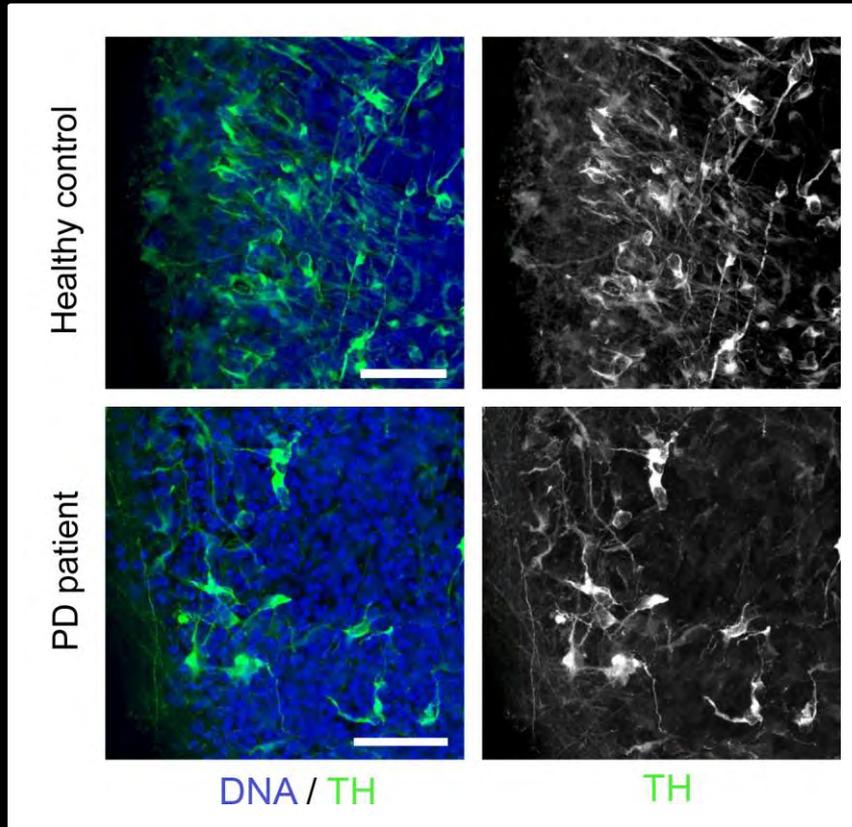

Pyknotic pixel removal

Feature extraction

- marker expression
- neurite complexity
- branching

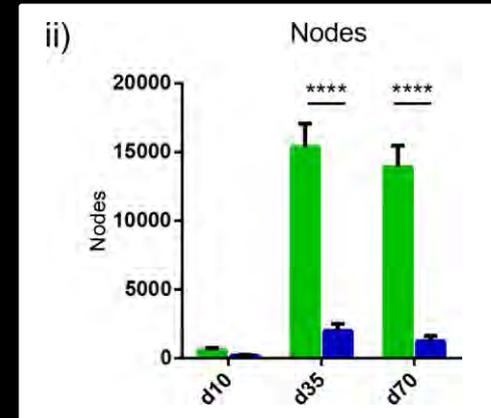

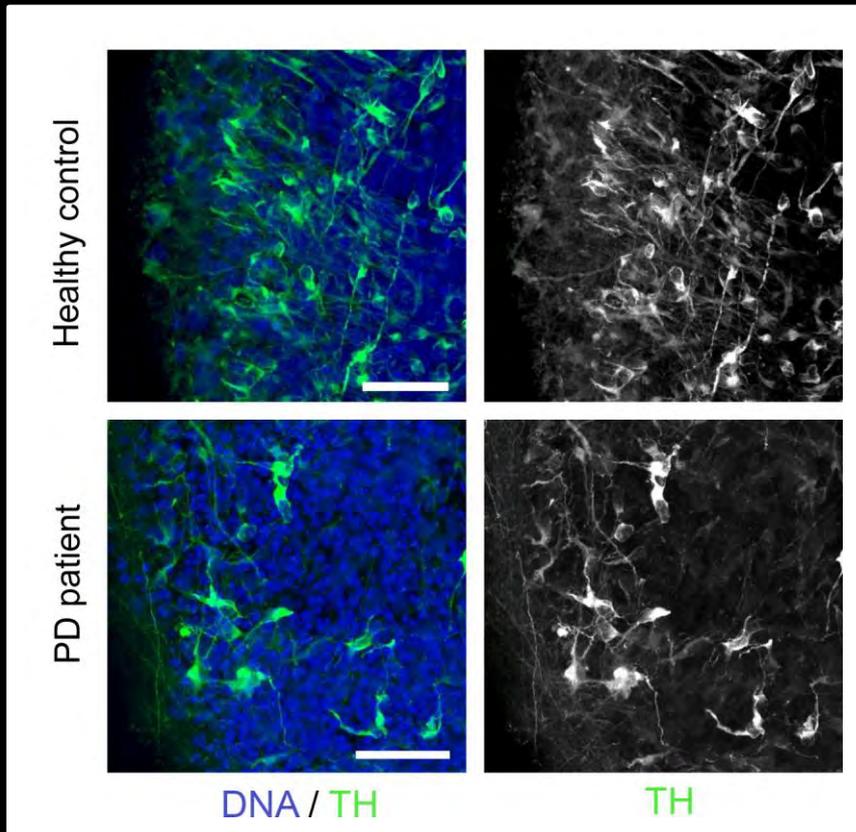

→ standardised procedure for efficient image analysis

PD: Reduction in the amount of dopaminergic neurons

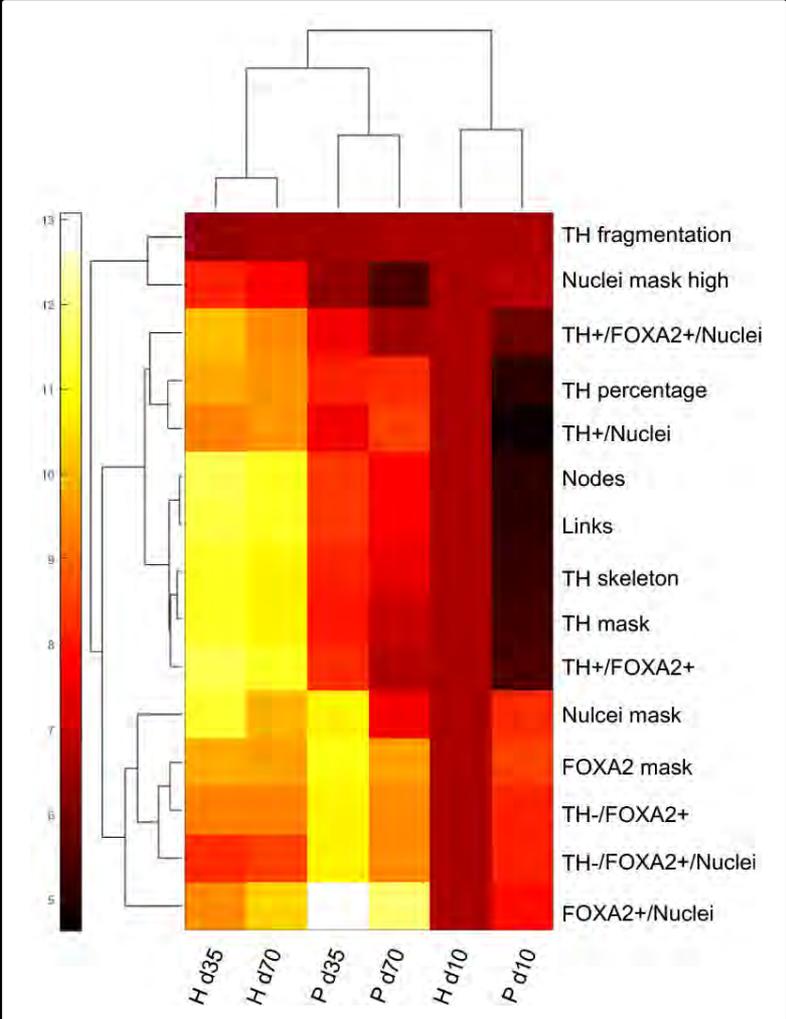

PD patient: LRRK2-G2019S

PD: Reduced complexity of dopaminergic neurons

PD patient: LRRK2-G2019S

Clustering by PD vs. Healthy

Summary

- 1) Differentiation of complex 3D neuronal networks in microfluidics plates.
 - Strong PD specific phenotype – neuronal degeneration
 - Rescue of phenotype with gene-correction or drug treatment

- 2) Generation & characterization of midbrain organoids.
 - Neuronal differentiation
 - Functionality: synapses, neuronal activity, Dopamine
 - Astroglia differentiation
 - Oligodendrocyte differentiation & myelination
 - Neuromelanin production
 - Disease relevant phenotypes
